

- Previous topic:
 - Introduction to `for`-loop
- Now:
 - Review `for`-loop
 - User-defined function

Pattern for doing something n times

```
n= _____
for k= 1:n
    % code to do
    % that something
end
```

Syntax of the `for` loop

```
for <var>= <start value>:<incr>:<end bound>
    statements to be executed repeatedly
end
```

Loop body

Syntax of the `for` loop

```
for <var>= <start value>:<incr>:<end bound>
    statements to be executed repeatedly
end
```

Loop header specifies all the values that the index variable will take on, one for each pass of the loop.
E.g. `k= 3:1:7` means `k` will take on the values 3, 4, 5, 6, 7, one at a time.

`for` loop examples

```
for k= 2:0.5:3
    disp(k)
end
for k= 1:4
    disp(k)
end
for k= 0:-2:-6
    disp(k)
end
for k= 0:-2:-7
    disp(k)
end
for k= 5:2:1
    disp(k)
end
```

`k` takes on the values _____
Non-integer increment is OK

`k` takes on the values _____
Default increment is 1

`k` takes on the values _____
"Increment" may be negative

`k` takes on the values _____
Colon expression specifies a bound

In the loop body, never change the value of the loop variable

```
n= _____
for k= 1:n
    % code to do
    % that something
end
```

Another way to estimate π

$$1 + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \dots \approx \frac{\pi^2}{6}$$

Write a script to sum 100 terms of the above series and then calculate π .

11

Drawing ASCII diagrams

Print these diagrams on the Command Window

```

*****
*****
*****
*****
*****
*****

```

Printing is done **left to right** and **top to bottom**.
 What is a simpler (sub)problem?

→ Print just one row of asterisks.

What is an even simpler (sub)problem?

→ Print just one single asterisk!

12

Keyword to indicate this is a function file (not a script)

```

function printRepeatChar(theChar,n)
% Print to the Command Window the
% character in variable theChar n times.
% n is non-negative integer.
% Add a linebreak.

for k= 1:n
    fprintf('%c', theChar)
end
fprintf('\n')

```

13

Function name, same as the file name

```

function printRepeatChar(theChar,n)
% Print to the Command Window the
% character in variable theChar n times.
% n is non-negative integer.
% Add a linebreak.

for k= 1:n
    fprintf('%c', theChar)
end
fprintf('\n')

```

14

Parameters, also called input parameters

```

function printRepeatChar(theChar,n)
% Print to the Command Window the
% character in variable theChar n times.
% n is non-negative integer.
% Add a linebreak.

for k= 1:n
    fprintf('%c', theChar)
end
fprintf('\n')

```

15

Function header

```

function printRepeatChar(theChar,n)
% Print to the Command Window the
% character in variable theChar n times.
% n is non-negative integer.
% Add a linebreak.

for k= 1:n
    fprintf('%c', theChar)
end
fprintf('\n')

```

16

Function comments, or specifications
(VERY IMPORTANT to have this comment)

```
function printRepeatChar(theChar,n)
% Print to the Command Window the
% character in variable theChar n times.
% n is non-negative integer.
% Add a linebreak.

for k= 1:n
    fprintf('%c', theChar)
end
fprintf('\n')
```

Function body

Calling a function (invoking a function)

- I have a function with this header:

```
function printRepeatChar(theChar,n)
```
- I will call function printRepeatChar like this:

```
printRepeatChar('*',8)
```
- The function header tells you everything you need to know about how to call the function

Drawing ASCII diagrams

```
*****
*****
*****
*****
*****
```

```

*
**
***
****
****
*****
```

```
% printRectangle
for r= 1:4
    % Print rth row
    printRepeatChar('*',7)
end
```

Given this function:

```
function m = convertLength(ft,in)
% Convert length from feet (ft) and inches (in)
% to meters (m).
. . .
```

How many proper calls to convertLength are shown below?

```
f= ...; n= ...;
d= convertLength(f,n);
d= convertLength(f*12+n);
d= convertLength(f+n/12);
x= min(convertLength(f,n), 1);
y= convertLength(pi*(f+n/12)^2);
```

A: 1
 B: 2
 C: 3
 D: 4
 E: 5 or 0

General form of a user-defined function

```
function [out1, out2, ...]= functionName (in1, in2, ...)
% 1-line comment to describe the function
% Additional description of function

Executable code that at some point assigns
values to output parameters out1, out2, ...
```

- in1, in2, ...* are defined when the function begins execution. Variables *in1, in2, ...* are called function *parameters* and they hold the function *arguments* used when the function is invoked (called).
- out1, out2, ...* are not defined until the executable code in the function assigns values to them.

My twinkling stars ...

- What is the algorithm? First, what are the individual tasks?

Implement this function

```
function r = randReal(lo,hi)
% r is a random real number in the
% interval (lo,hi)
```

23

Implement this function

```
function [x,y] = randPt(lo,hi)
% x and y are random real numbers in the
% interval (lo,hi)
```

25
