
GRAPHS

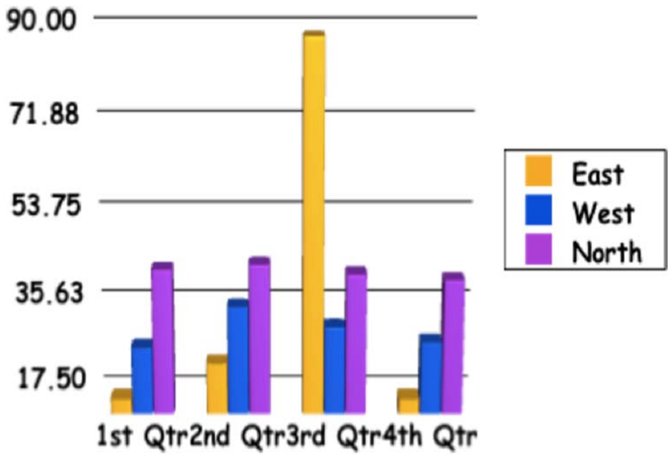
Lecture 19

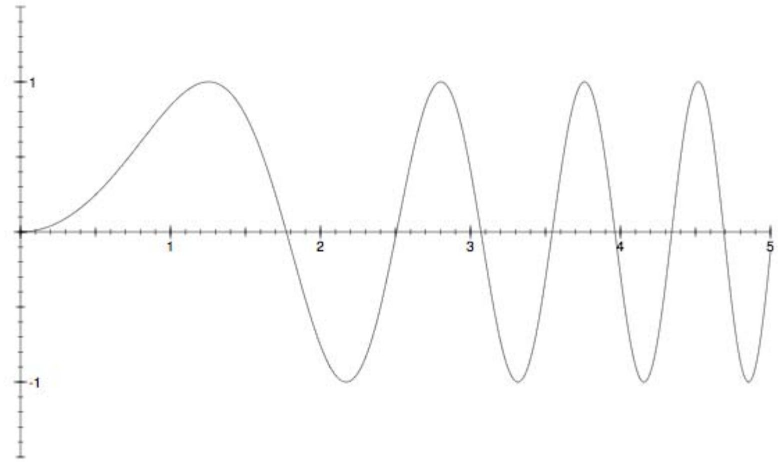
CS2110 – Spring 2013

Announcements

- Prelim 2: Two and a half weeks from now
  - Tuesday, April16, 7:30-9pm, Statler
- Exam conflicts?
  - We need to hear about them and can arrange a makeup
  - It would be the same day but 5:30-7:00
- Old exams available on the course website

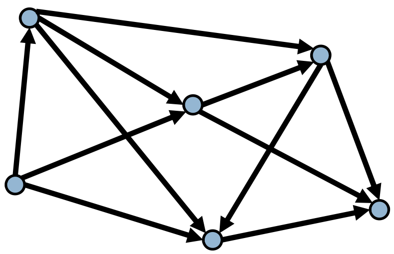
These are not Graphs

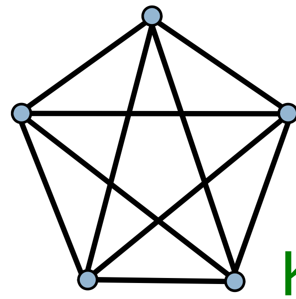




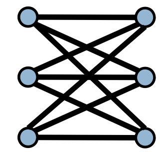
...not the kind we mean, anyway

These are Graphs

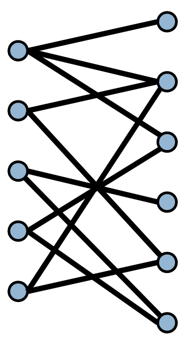


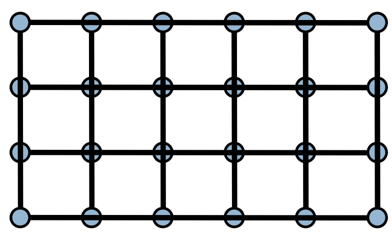


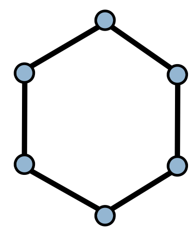
K_5



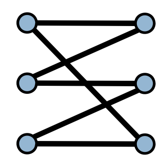
$K_{3,3}$







=



Applications of Graphs

- Communication networks
- Routing and shortest path problems
- Commodity distribution (flow)
- Traffic control
- Resource allocation
- Geometric modeling
- ...

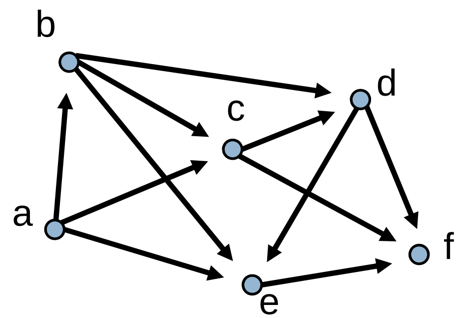
Graph Definitions

- A directed graph (or digraph) is a pair (V, E) where
  - V is a set
  - E is a set of ordered pairs (u,v) where u,v □ V
    - Usually require u   v (i.e., no self-loops)

- An element of V is called a vertex (pl. vertices) or node
- An element of E is called an edge or arc

- |V| = size of V, often denoted n
- |E| = size of E, often denoted m

Example Directed Graph (Digraph)



V = {a,b,c,d,e,f }

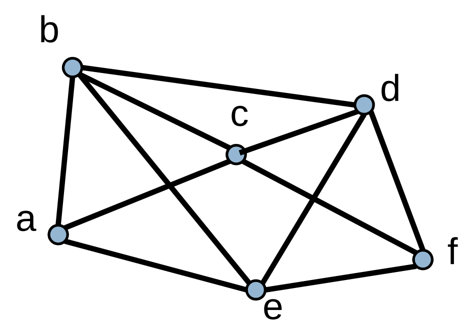
E = {(a,b), (a,c), (a,e), (b,c), (b,d), (b,e), (c,d),
(c,f), (d,e), (d,f), (e,f)}

|V| = 6, |E| = 11

Example *Undirected* Graph

An *undirected graph* is just like a directed graph, except the edges are *unordered pairs* (*sets*) {u,v}

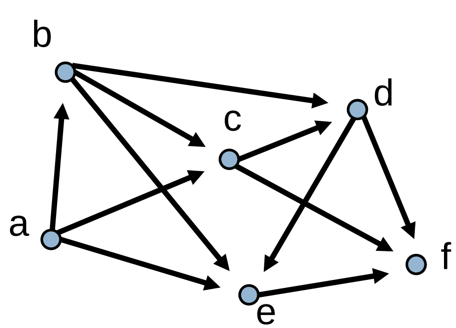
Example:

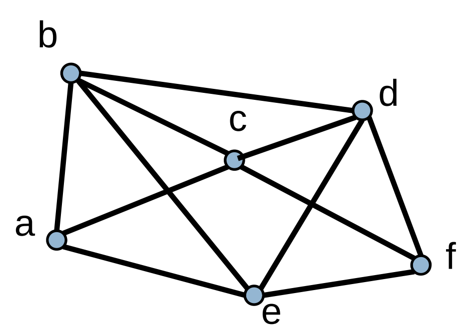


V = {a,b,c,d,e,f}
E = {{a,b}, {a,c}, {a,e}, {b,c}, {b,d}, {b,e}, {c,d}, {c,f}, {d,e}, {d,f}, {e,f}}

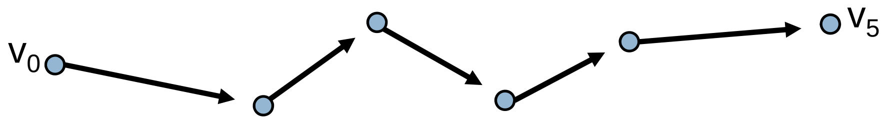
Some Graph Terminology

- Vertices u and v are called the source and sink of the directed edge (u,v), respectively
- Vertices u and v are called the endpoints of (u,v)
- Two vertices are adjacent if they are connected by an edge
- The outdegree of a vertex u in a directed graph is the number of edges for which u is the source
- The indegree of a vertex v in a directed graph is the number of edges for which v is the sink
- The degree of a vertex u in an undirected graph is the number of edges of which u is an endpoint

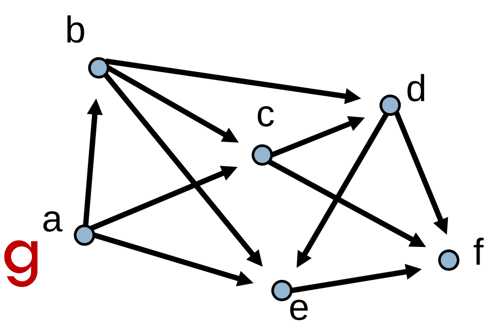




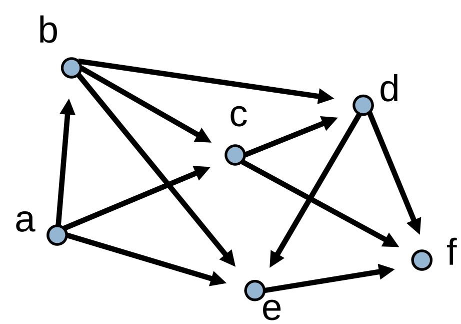
More Graph Terminology



- A path is a sequence $v_0, v_1, v_2, \ldots, v_p$ of vertices such that $(v_i, v_{i+1}) \in E$, $0 \leq i \leq p - 1$
- The length of a path is its number of edges
  - In this example, the length is *5*
- A path is simple if it does not repeat any vertices
- A cycle is a path $v_0, v_1, v_2, \ldots, v_p$ such that $v_0 = v_p$
- A cycle is simple if it does not repeat any vertices except the first and last
- A graph is acyclic if it has no cycles
- A directed acyclic graph is called a dag

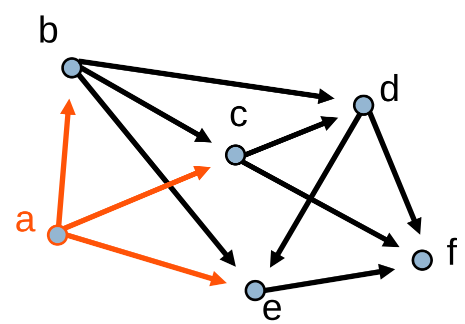


Is This a Dag?



- Intuition:
  - If it's a dag, there must be a vertex with indegree zero – why?
- This idea leads to an algorithm
  - A digraph is a dag if and only if we can iteratively delete indegree-0 vertices until the graph disappears

Is This a Dag?



- Intuition:
  - If it's a dag, there must be a vertex with indegree zero – why?
- This idea leads to an algorithm
  - A digraph is a dag if and only if we can iteratively delete indegree-0 vertices until the graph disappears

- This idea leads to an algorithm
  - A digraph is a dag if and only if we can iteratively delete indegree-0 vertices until the graph disappears

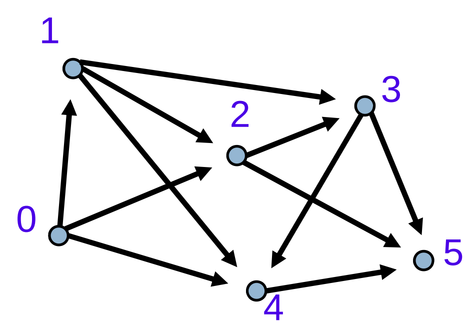
Topological Sort

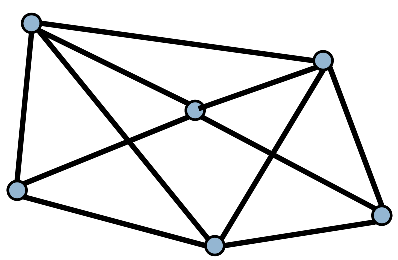
- We just computed a topological sort of the dag
  - This is a numbering of the vertices such that all edges go from lower- to higher-numbered vertices



- Useful in job scheduling with precedence constraints

Graph Coloring

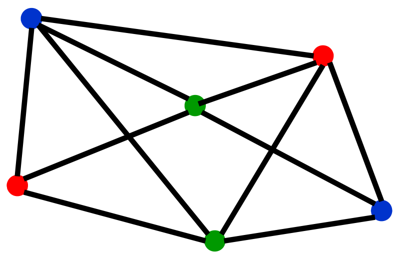
- A coloring of an undirected graph is an assignment of a color to each node such that no two adjacent vertices get the same color



- How many colors are needed to color this graph?

Graph Coloring

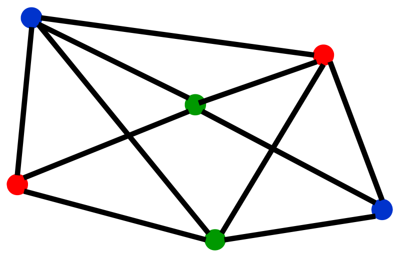
- A coloring of an undirected graph is an assignment of a color to each node such that no two adjacent vertices get the same color



- How many colors are needed to color this graph?
  - 3

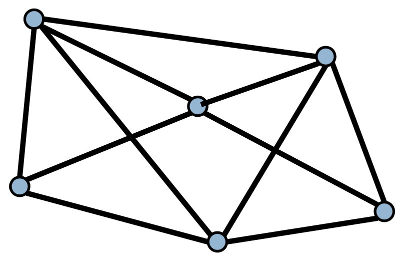
An Application of Coloring

- Vertices are jobs
- Edge (u,v) is present if jobs u and v each require access to the same shared resource, and thus cannot execute simultaneously
- Colors are time slots to schedule the jobs
- Minimum number of colors needed to color the graph = minimum number of time slots required



Planarity

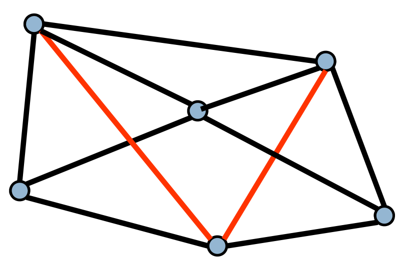
- A graph is planar if it can be embedded in the plane with no edges crossing



- Is this graph planar?

Planarity

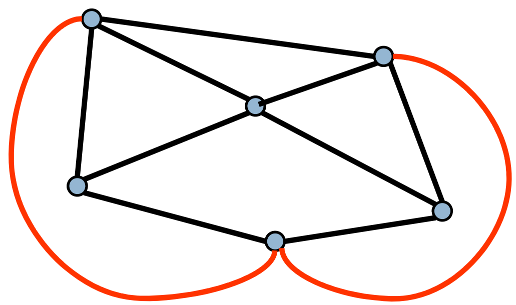
- A graph is planar if it can be embedded in the plane with no edges crossing



- Is this graph planar?
  - Yes

Planarity

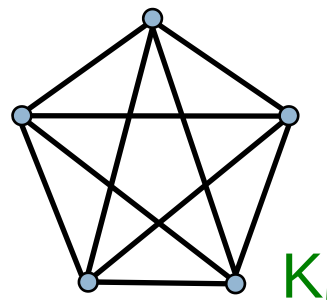
- A graph is planar if it can be embedded in the plane with no edges crossing



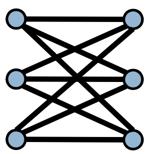
- Is this graph planar?
  - Yes

Detecting Planarity

- Kuratowski's Theorem



K_5



$K_{3,3}$

- A graph is planar if and only if it does not contain a copy of K_5 or $K_{3,3}$ (possibly with other nodes along the edges shown)

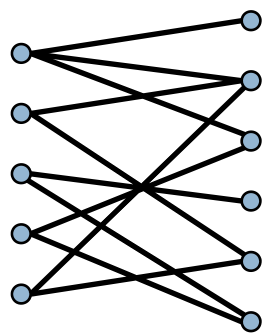
The Four-Color Theorem

Every planar graph is 4-colorable

(Appel & Haken, 1976)

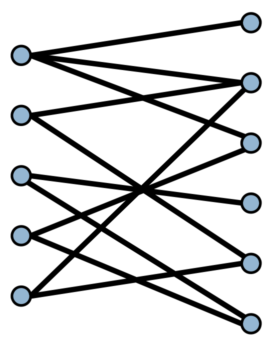
Bipartite Graphs

- A directed or undirected graph is bipartite if the vertices can be partitioned into two sets such that all edges go between the two sets

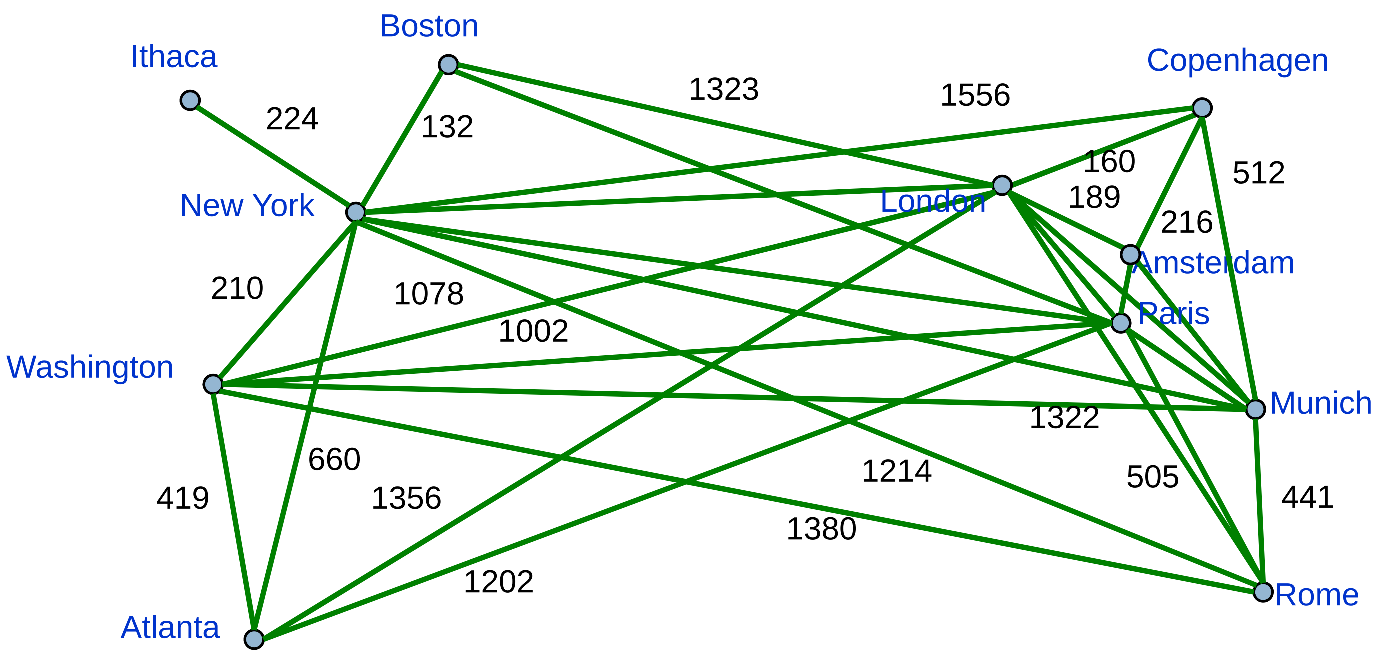


Bipartite Graphs

- The following are equivalent
  - G is bipartite
  - G is 2-colorable
  - G has no cycles of odd length

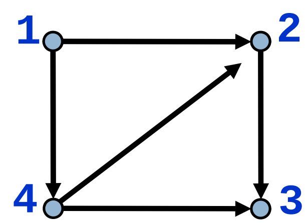


Traveling Salesperson

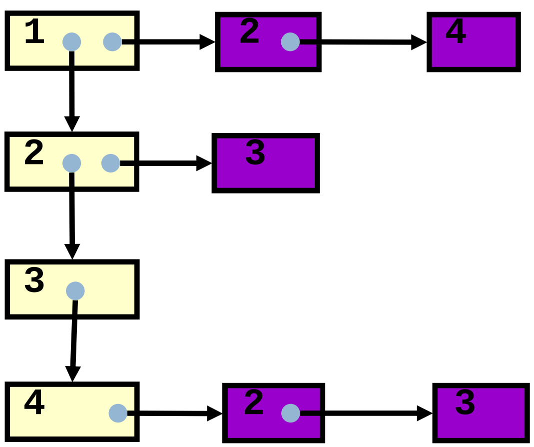


- Find a path of minimum distance that visits every city

Representations of Graphs



Adjacency List



Adjacency Matrix

	1	2	3	4
1	0	1	0	1
2	0	0	1	0
3	0	0	0	0
4	0	1	1	0

Adjacency Matrix or Adjacency List?

- n = number of vertices
- m = number of edges
- d(u) = degree of u = number of edges leaving u

- Adjacency Matrix
  - Uses space $O(n^2)$
  - Can iterate over all edges in time $O(n^2)$
  - Can answer "Is there an edge from u to v?" in O(1) time
  - Better for dense graphs (lots of edges)

- Adjacency List
  - Uses space O(m+n)
  - Can iterate over all edges in time O(m+n)
  - Can answer "Is there an edge from u to v?" in O(d(u)) time
  - Better for sparse graphs (fewer edges)

Graph Algorithms

- Search
  - depth-first search
  - breadth-first search
- Shortest paths
  - Dijkstra's algorithm
- Minimum spanning trees
  - Prim's algorithm
  - Kruskal's algorithm

Depth-First Search

- Follow edges depth-first starting from an arbitrary vertex r, using a stack to remember where you came from
- When you encounter a vertex previously visited, or there are no outgoing edges, retreat and try another path
- Eventually visit all vertices reachable from r
- If there are still unvisited vertices, repeat
- O(m) time

Depth-First Search

Breadth-First Search

- Same, except use a queue instead of a stack to determine which edge to explore next
  - Recall: A stack is last-in, first-out (LIFO)
  - A queue is first-in, first-out (FIFO)

Summary

- We've seen an introduction to graphs and will return to this topic next week on Tuesday
  - Definitions
  - Testing for a dag
  - Depth-first and breadth-first search

- On Thursday Ken and David will be out of town.
  - Dexter Kozen will do a lecture on induction
  - We use induction to prove properties of graphs and graph algorithms, so the fit is good
