Graphs

Representing Graphs

Adjacency List

Adjacency Matrix

	1	2	3	4
1	0	1	0	1
2	0	0	1	0
3	0	0	0	0
4	0	1	1	0

Graph Interface

```

public interface Graph {
    /** Return the number of nodes in the graph */
    public int numNodes();

    /** Return a list of edges in the graph */
    public List<Pair> getEdges();

    /** Check whether an edge exists */
    public boolean hasEdge(int u, int v);

    /** Return a list of neighbors of n.
     * Precondition: 0 <= n < number of nodes */
    public List<Integer> getNeighbors(int n);

    /** Print the graph.
     * Precondition: the graph has < 100 nodes */
    public void printGraph();
}

```

Pair Class

```

/** An instance is an ordered pair of integers */
public class Pair {
    public int one; // the ordered pair (one, two)
    public int two;

    /** Constructor: a pair of ints h and k. */
    public Pair(int h, int k) {
        one = h;
        two = k;
    }

    /** A representation (h, k) of this pair.*/
    public String toString() {
        return "(" + one + ", " + two + ")";
    }
}

```

MatrixGraph Class

```

/** An instance is a graph maintained as an adjacency
matrix */
public class MatrixGraph implements Graph{
    public boolean[][] matrix; // adjacency matrix
    public int n; // number of nodes
    public int m; // number of edges

    /** A graph with n nodes numbers 0..n-1 and edges
    * given by edges. */
    public MatrixGraph(int numNodes, Pair[] edges) {
        n= numNodes;
        m= edges.length;

        matrix= new boolean[n][n];
        for (Pair p : edges) {
            matrix[p.one][p.two]= true;
        }
    }
}
    
```

Search on Graphs

- Given a graph (V, E) and a vertex $u \in V$
- We want to "visit" each node that is reachable from u

There are many paths to some nodes.

How do we visit all nodes efficiently, without doing extra work?

Depth-First Search

Intuition: Recursively visit all vertices that are reachable along unvisited paths.

```

/** Visit all nodes reachable
on unvisited paths from u.
Precondition: u is unvisited.
*/
public static void dfs(int u) {
    mark u
    for all edges (u,v):
        if v is unmarked:
            dfs(v);
}
    
```

dfs(1) visits the nodes in this order: 1, 2, 3, 5, 7, 8

Depth-First Search

Intuition: Recursively visit all vertices that are reachable along unvisited paths.

```

/** Visit all nodes reachable
on unvisited paths from u.
Precondition: u is unvisited.
*/
public static void dfs(int u) {
    mark u
    for all edges (u,v):
        if v is unmarked:
            dfs(v);
}
    
```

Suppose there are n vertices that are reachable along unvisited paths and m edges:

Worst-case running time? $O(n + m)$

Worst-case space? $O(n)$

DFS Quiz

- In what order would a DFS visit the vertices of this graph? Break ties by visiting the lower-numbered vertex first.

- 1, 2, 3, 4, 5, 6, 7, 8
- 1, 2, 5, 6, 3, 6, 7, 4, 7, 8
- 1, 2, 5, 3, 6, 4, 7, 8
- 1, 2, 5, 6, 3, 7, 4, 8

Depth-First Search in Java

14

Eclipse!

Depth-First Search Iteratively

15

Intuition: Visit all vertices that are reachable along unvisited paths from the current node.

```

/** Visit all nodes reachable on
unvisited paths from u. */
public static void dfs(int u) {
    Stack s= new Stack
    s.push(u);
    while (s is not empty) {
        u= s.pop();
        if (u not visited) {
            visit u;
            for each edge (u, v):
                s.push(v);
        }
    }
}
    
```

Stack:

8
5
3

Breadth-First Search

16

Intuition: Iteratively process the graph in "layers" moving further away from the source node.

BFS Quiz

17

□ In what order would a BFS visit the vertices of this graph? Break ties by visiting the lower-numbered vertex first.

- 1, 2, 3, 4, 5, 6, 7, 8
- 1, 2, 3, 4, 5, 6, 6, 7, 7, 8
- 1, 2, 5, 3, 6, 4, 7, 8
- 1, 2, 5, 6, 3, 7, 4, 8

Breadth-First Search

18

Intuition: Iteratively process the graph in "layers" moving further away from the source node.

```

/** Visit all nodes reachable on
unvisited paths from u. */
public static void bfs(int u) {
    Queue q= new Queue
    q.add(u);
    while ( q is not empty ) {
        u= q.remove();
        if (u not visited) {
            visit u;
            for each (u, v):
                q.add(v);
        }
    }
}
    
```

Queue:

2	5	7	3	5	8	5
---	---	---	---	---	---	---

Analyzing BFS

19

Intuition: Iteratively process the graph in "layers" moving further away from the source node.

```

/** Visit all nodes reachable on
unvisited paths from u. */
public static void bfs(int u) {
    Queue q= new Queue
    q.add(u);
    while ( q is not empty ) {
        u= q.remove();
        if (u not visited) {
            visit u;
            for each (u, v):
                q.add(v);
        }
    }
}
    
```

Suppose there are n vertices that are reachable along unvisited paths and m edges:

Worst-case running time? $O(n + m)$

Worst-case space? $O(m)$

Comparing Search Algorithms

20

DFS

- Visits: 1, 2, 3, 5, 7, 8

- Time: $O(n + m)$

- Space: $O(n)$

BFS

- Visits: 1, 2, 5, 7, 3, 8

- Time: $O(n + m)$

- Space: $O(m)$
