Example: “Decorated” Programs

\{x = n \land n > 0\}

\begin{align*}
y &:= 1; \\
\textbf{while} \ x > 0 \ \textbf{do} \{ \\
\quad &y := y \times x; \\
\quad &x := x - 1 \\
\} \\
\{y = n!\}
\end{align*}
Example: “Decorated” Programs

\{ x = n \land n > 0 \} \implies \\
\{ 1 = 1 \land x = n \land n > 0 \} \\
y := 1; \\
\{ y = 1 \land x = n \land n > 0 \} \implies \\
\{ y \times x! = n! \land x \geq 0 \} \\
\textbf{while} x > 0 \textbf{ do } \{ \\
\quad \{ y \times x! = n! \land x > 0 \land x \geq 0 \} \implies \\
\quad \{ y \times x \times (x - 1)! = n! \land (x - 1) \geq 0 \} \\
\quad y := y \times x; \\
\quad \{ y \times (x - 1)! = n! \land (x - 1) \geq 0 \} \\
\quad x := x - 1 \\
\quad \{ y \times x! = n! \land x \geq 0 \} \\
\textbf{end while} \\
\{ y \times x! = n! \land (x \geq 0) \land \neg(x > 0) \} \implies \\
\{ y = n! \}
Soundness and Completeness

**Definition (Soundness)**

If $\vdash \{P\} c \{Q\}$ then $\models \{P\} c \{Q\}$.

**Definition (Completeness)**

If $\models \{P\} c \{Q\}$ then $\vdash \{P\} c \{Q\}$.
Theorem (Soundness)

If \( \vdash \{ P \} c \{ Q \} \) then \( \models \{ P \} c \{ Q \} \).
Soundness and Completeness

Theorem (Soundness)

If $\vdash \{P\} c \{Q\}$ then $\models \{P\} c \{Q\}$.

Proof.

By induction on $\{P\} c \{Q\}$...
Soundness and Completeness

Theorem (Soundness)

If \( \vdash \{ P \} \ c \ \{ Q \} \) then \( \models \{ P \} \ c \ \{ Q \} \).

Proof.

By induction on \( \{ P \} \ c \ \{ Q \} \)...

Lemma (Substitution)

- \( \sigma \models_\ i P[a/x] \iff \sigma[x \mapsto A[a] \sigma] \models_\ i P \)
- \( A[a_0[a/x]] (\sigma, l) \iff A[a_0] (\sigma[x \mapsto A[a] (\sigma, l)], l) \)
Decidability

Suppose we had an algorithm for deciding the validity of partial correctness statements...

Then we could decide

\{ \textbf{true} \} \ \textbf{skip} \ \{ P \}
Decidability

Suppose we had an algorithm for deciding the validity of partial correctness statements...

Then we could decide

\{\text{true}\} \ skip \ \{P\}

and

\{\text{true}\} \ c \ \{\text{false}\}
Decidability

Suppose we had an algorithm for deciding the validity of partial correctness statements...

Then we could decide

\{true\} \skip \{P\}

and

\{true\} \ c \ \{false\}

The first is valid if and only if the assertion \(P\) is valid

The second is valid if and only if the command \(c\) halts.
Completeness

But although we cannot decide validity, Hoare logic does enjoy the completeness property stated in the following theorem:

**Theorem (Cook (1974))**

\[
\forall P, Q \in \textbf{Assn}, c \in \textbf{Com}. \models \{P\} c \{Q\} \implies \vdash \{P\} c \{Q\}.
\]
But although we cannot decide validity, Hoare logic does enjoy the completeness property stated in the following theorem:

**Theorem (Cook (1974))**

\[ \forall P, Q \in \text{Assn}, c \in \text{Com}. \quad \vdash \{P\} c \{Q\} \text{ implies } \vdash \{P\} c \{Q\}. \]

It turns out that the key culprit that breaks decidability is the Consequence rule.

It includes two premises involving the validity of implications between arbitrary assertions.

But if we had an oracle that could decide the validity of assertions, then we could decide the validity of partial correctness specifications.
Weakest Preconditions

Cook’s proof is based on **weakest preconditions**

**Intuition:** the weakest liberal precondition for $c$ and $Q$ is the weakest assertion $P$ such that $\{P\} c \{Q\}$ is valid

More formally...

**Definition (Weakest Liberal Precondition)**

$P$ is a weakest liberal precondition of $c$ and $Q$ written $wlp(c, Q)$ if:

$$\forall \sigma, l. \sigma \models_{l} P \iff (C[c] \sigma) \text{ undefined } \lor (C[c] \sigma) \models_{l} Q$$
Weakest Preconditions

\[ wlp(\text{skip}, P) = P \]
Weakest Preconditions

\[\text{wlp}(\text{skip}, P) = P\]
\[\text{wlp}((x := a, P) = P[a/x]\]
Weakest Preconditions

\[
\begin{align*}
  \text{wlp}(\text{skip}, P) & = P \\
  \text{wlp}((x := a, P) & = P[a/x] \\
  \text{wlp}((c_1; c_2), P) & = \text{wlp}(c_1, \text{wlp}(c_2, P))
\end{align*}
\]
Weakest Preconditions

\[
\begin{align*}
\text{wlp}(\text{skip}, P) &= P \\
\text{wlp}((x := a, P) &= P[a/x] \\
\text{wlp}((c_1; c_2), P) &= \text{wlp}(c_1, \text{wlp}(c_2, P)) \\
\text{wlp}(\text{if } b \text{ then } c_1 \text{ else } c_2, P) &= (b \implies \text{wlp}(c_1, P)) \land \\
&\quad (\neg b \implies \text{wlp}(c_2, P))
\end{align*}
\]
Weakest Preconditions

\[ \text{wlp(} \text{skip, P}) = P \]
\[ \text{wlp(} (\text{x := a, P}) = P[a/x] \]
\[ \text{wlp(} (c_1; c_2), P) = \text{wlp(} c_1, \text{wlp(} c_2, P) \] \]
\[ \text{wlp(} \text{if b then c}_1 \text{ else c}_2, P) = (b \implies \text{wlp(} c_1, P)) \land \]
\[ (\neg b \implies \text{wlp(} c_2, P)) \]
\[ \text{wlp(} \text{while b do c, P}) = \bigwedge_i F_i(P) \]
Weakest Preconditions

\[\begin{align*}
\text{wlp}(& \text{skip}, P) = P \\
\text{wlp}((x := a, P) = P[a/x] \\
\text{wlp}((c_1; c_2, P) = \text{wlp}(c_1, \text{wlp}(c_2, P)) \\
\text{wlp}(\text{if } b \text{ then } c_1 \text{ else } c_2, P) = (b \implies \text{wlp}(c_1, P)) \land \neg b \implies \text{wlp}(c_2, P)) \\
\text{wlp}(\text{while } b \text{ do } c, P) = \bigwedge_i F_i(P) \end{align*}\]

where

\[\begin{align*}
F_0(P) &= \text{true} \\
F_{i+1}(P) &= (\neg b \implies P) \land (b \implies \text{wlp}(c, F_i(P))) \end{align*}\]
Properties of Weakest Precondition

Lemma (Correctness of Weakest Preconditions)

\[ \forall c \in \text{Com}, Q \in \text{Assn}. \]
\[ \vdash \{wlp(c, Q)\} c \{Q\} \quad \text{and} \]
\[ \forall R \in \text{Assn}. \quad \vdash \{R\} c \{Q\} \quad \text{implies} \quad (R \implies wlp(c, Q)) \]
Lemma (Correctness of Weakest Preconditions)

\[ \forall c \in \text{Com}, Q \in \text{Assn.} \]
\[ \vdash \{ wlp(c, Q) \} c \{ Q \} \quad \text{and} \]
\[ \forall R \in \text{Assn.} \quad \vdash \{ R \} c \{ Q \} \quad \text{implies} \quad (R \implies wlp(c, Q)) \]

Lemma (Provability of Weakest Preconditions)

\[ \forall c \in \text{Com}, Q \in \text{Assn.} \quad \vdash \{ wlp(c, Q) \} c \{ Q \} \]
Relative Completeness

Theorem (Cook (1974))

\[ \forall P, Q \in \text{Assn}, c \in \text{Com}. \quad \vdash \{P\} c \{Q\} \implies \vdash \{P\} c \{Q\}. \]

Proof Sketch.

Let \( \{P\} c \{Q\} \) be a valid partial correctness specification.

By the first Lemma we have \( \vdash P \iff wlp(c, Q) \).

By the second Lemma we have \( \vdash \{wlp(c, Q)\} c \{Q\} \).

We conclude \( \vdash \{P\} c \{Q\} \) using Consequence rule.
