

## Relational Operations

* We will consider how to implement:
- Selection $(\sigma)$ Selects a subset of rows from relation.
- Projection $(\pi)$ Deletes unwanted columns from relation.
- Loin ( $\bowtie$ ) Allows us to combine two relations.
- Set-difference (一) Tuples in reln. 1, but not in reln. 2.
- Union (U) Tuples in reln. 1 and in reln. 2.
- Aggregation (SUM, MIN, etc.) and GROUP BY

Since each op returns a relation, ops can be composed! After we cover the operations, we will discuss how to optimize queries formed by composing them.

CS432 Fall 2007

## Schema for Examples

Sailors (sid: integer, sname: string, rating: integer, age: real) Reserves (sid: integer, bid: integer, day: dates, rname: string)

* Similar to old schema; rname added for variations.
* Reserves:
- Each tuple is 40 bytes long, 100 tuples per page, 1000 pages. $\%$ Sailors:
- Each tuple is 50 bytes long, 80 tuples per page, 500 pages.

## Equality Joins With One Join Column

SELECT *
FROM Reserves R1, Sailors S1
WHERE R1.sid=S1.sid
In algebra: $\mathrm{R} \bowtie \mathrm{S}$. Common! Must be carefully optimized. $\mathrm{R} \times \mathrm{S}$ is large; so, $\mathrm{R} \times \mathrm{S}$ followed by a selection is inefficient.
Assume: M pages in $R, p_{R}$ tuples per page, $N$ pages in $S, p_{S}$ tuples per page.

- In our examples, R is Reserves and S is Sailors.
* We will consider more complex join conditions later.
* Cost metric: \# of I/Os. We will ignore output costs.

## Simple Nested Loops Join

$$
\begin{aligned}
& \text { foreach tuple } r \text { in } R \text { do } \\
& \text { foreach tuple } s \text { in } S \text { do } \\
& \qquad \text { if } r_{i}==s_{j} \text { then add }\langle r, s>\text { to result }
\end{aligned}
$$

* For each tuple in the outer relation R, we scan the entire inner relation S .
- Cost: $\mathrm{M}+\mathrm{p}_{\mathrm{R}}{ }^{*} \mathrm{M} * \mathrm{~N}=1000+100 * 1000 * 500 \mathrm{I} / \mathrm{Os}$.
* Page-oriented Nested Loops join: For each page of R, get each page of S , and write out matching pairs of tuples $\langle\mathrm{r}, \mathrm{s}\rangle$, where r is in R-page and S is in S page.
- Cost: $\mathrm{M}+\mathrm{M}^{*} \mathrm{~N}=1000+1000 * 500$

CS432Falffersinaller relation (S) is outer, cost $=500+500 * 1000$
$\qquad$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Index Nested Loops Join

> foreach tuple $r$ in $R$ do
> foreach tuple $s$ in $S$ where $r_{i}==s_{j}$ do add $\langle r, s>$ to result

* If there is an index on the join column of one relation $\qquad$ (say S), can make it the inner and exploit the index. $\qquad$
*For each $R$ tuple, cost of probing $S$ index is about 1.2 for hash index, 2-4 for B+ tree. Cost of then finding S tuples (assuming Alt. (2) or (3) for data entries) depends on clustering.
- Clustered index: 1 I/O (typical), unclustered: upto 1 I/O per matching S tuple.
CS432 Fal12007

| Examples of Index Nested Loops <br> * Hash-index (Alt. 2) on sid of Sailors (as inner): <br> - Scan Reserves: 1000 page I/Os, $100 * 1000$ tuples. <br> - For each Reserves tuple: 1.2 I/Os to get data entry in index, plus 1 I/O to get (the exactly one) matching Sailors tuple. Total: 220,000 I/Os. <br> * Hash-index (Alt. 2) on sid of Reserves (as inner): <br> - Scan Sailors: 500 page I/Os, $80 * 500$ tuples. <br> - For each Sailors tuple: $1.2 \mathrm{I} / \mathrm{Os}$ to find index page with data entries, plus cost of retrieving matching Reserves tuples. Assuming uniform distribution, 2.5 reservations per sailor $(100,000 / 40,000)$. Cost of retrieving them is 1 or 2.5 I/Os depending on whether the index is clustered. |
| :---: |
|  |  |
|  |  |

CS432 Fall 2007

## Block Nested Loops Join

* Use one page as an input buffer for scanning the inner S, one page as the output buffer, and use all remaining pages to hold "block" of outer R.
- For each matching tuple r in R-block, s in S-page, add $\langle r, s>$ to result. Then read next R-block, scan S, etc.

CS432 Fall 2007

## Examples of Block Nested Loops

* Cost: Scan of outer + \#outer blocks * scan of inner - \#outer blocks = 「\# of pages of outer / blocksize $\rceil$
* With Reserves (R) as outer, and 100 pages of R:
- Cost of scanning R is $1000 \mathrm{I} / \mathrm{Os}$; a total of 10 blocks.
- Per block of R, we scan Sailors (S); 10*500 I/Os.
- If space for just 90 pages of $R$, we would scan $S 12$ times.
* With 100-page block of Sailors as outer:
- Cost of scanning S is $500 \mathrm{I} / \mathrm{Os}$; a total of 5 blocks.
- Per block of S, we scan Reserves; 5*1000 I/Os.
* With sequential reads considered, analysis changes: may be best to divide buffers evenly between R and S . cS432 Fall 2007

## Sort-Merge Join $(R \underset{i=j}{\bowtie} S)$

* Sort R and S on the join column, then scan them to do
a "merge" (on join col.), and output result tuples.
- Advance scan of R until current R -tuple >= current S tuple,
$\qquad$ then advance scan of $S$ until current S-tuple $>=$ current $R$ tuple; do this until current R tuple $=$ current $S$ tuple.
- At this point, all R tuples with same value in $\operatorname{Ri}$ (current $R$ group) and all S tuples with same value in Sj (current $S$ group) match; output $<\mathrm{r}, \mathrm{s}>$ for all pairs of such tuples.
- Then resume scanning $R$ and $S$.
- $R$ is scanned once; each $S$ group is scanned once per matching R tuple. (Multiple scans of an $S$ group are likely to find needed pages in buffer.)

| Example of Sort-Merge Join |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | sid | bid | day | rname |
| sid | sname | rating | age | 28 | 103 | 12/4/96 | guppy |
| 22 | dustin | 7 | 45.0 | 28 | 103 | 11/3/96 | yuppy |
| 28 | yuppy | 9 | 35.0 | 31 | 101 | 10/10/96 | dustin |
| 31 | lubber | 8 | 55.5 | 31 | 102 | 10/12/96 | lubber |
| 44 | guppy | 5 | 35.0 | 31 | 101 | 10/11/96 | lubber |
| 58 | rusty | 10 | 35.0 | 58 | 103 | 11/12/96 | dustin |

* Cost: $\mathrm{M} \log \mathrm{M}+\mathrm{N} \log \mathrm{N}+(\mathrm{M}+\mathrm{N})$
- The cost of scanning, $\mathrm{M}+\mathrm{N}$, could be $\mathrm{M}^{*} \mathrm{~N}$ (very unlikely!) -With 35,100 or 300 buffer pages, both Reserves and Sailors can be sorted in 2 passes; total join cost: 7500. Cs432 Fall 2007 (BNL cost: 2500 to 15000 I/Os)

## Refinement of Sort-Merge Join

*We can combine the merging phases in the sorting of $R$ and $S$ with the merging required for the join.

- With $\mathrm{B}>\sqrt{L}$, where $L$ is the size of the larger relation, using the sorting refinement that produces runs of length 2 B in Pass 0 , \#runs of each relation is $<B / 2$.
- Allocate 1 page per run of each relation, and 'merge' while checking the join condition.
- Cost: read+write each relation in Pass $0+$ read each relation in (only) merging pass (+ writing of result tuples).
- In example, cost goes down from 7500 to 4500 I/Os.
* In practice, cost of sort-merge join, like the cost of external sorting, is linear.
CS432 Fall 2007

## Observations on Hash-Join

* \#partitions k < B-1 (why?), and B-2 > size of largest partition to be held in memory. Assuming uniformly sized partitions, and maximizing $k$, we get:
- $k=B-1$, and $M /(B-1)<B-2$, i.e., $B$ must be $>\sqrt{M}$
* If we build an in-memory hash table to speed up the matching of tuples, a little more memory is needed.
* If the hash function does not partition uniformly, one or more R partitions may not fit in memory. Can apply hash-join technique recursively to do the join of this R-partition with corresponding S-partition.
CS432 Fall 2007
14

## Cost of Hash-Join

* In partitioning phase, read+write both relns; $2(\mathrm{M}+\mathrm{N})$. In matching phase, read both relns; M+N I/Os.
* In our running example, this is a total of $4500 \mathrm{I} / \mathrm{Os}$.
* Sort-Merge Join vs. Hash Join:
- Given a minimum amount of memory (what is this, for each?) both have a cost of $3(\mathrm{M}+\mathrm{N}) \mathrm{I} / \mathrm{Os}$. Hash Join superior on this count if relation sizes differ greatly. Also, Hash Join shown to be highly parallelizable.
- Sort-Merge less sensitive to data skew; result is sorted.

## General Join Conditions

Equalities over several attributes (e.g., R.sid=S.sid AND R.rname=S.sname):

- For Index NL, build index on <sid, sname> (if S is inner); or use existing indexes on sid or sname.
- For Sort-Merge and Hash Join, sort/partition on combination of the two join columns.
* Inequality conditions (e.g., R.rname < S.sname):
- For Index NL, need (clustered!) B+ tree index.
- Range probes on inner; \# matches likely to be much higher than for equality joins.
- Hash Join, Sort Merge Join not applicable.
- Block NL quite likely to be the best join method here. CS432 Fall 2007
