Introduction (1/3)

What are Point Clouds?

- Point Cloud = a "cloud" (i.e., collection) of nD points (usually n = 3)
- $\blacktriangleright \boldsymbol{p}_i = \{\boldsymbol{x}_i, \boldsymbol{y}_i, \boldsymbol{z}_i\} \longrightarrow \mathcal{P} = \{\boldsymbol{p}_1, \boldsymbol{p}_2, \dots, \boldsymbol{p}_i, \dots, \boldsymbol{p}_n\}$
- used to represent 3D information about the world

Radu Bogdan RUSU

Motivation

Acquisition

Data representation

Storage

PCL Examples

Introduction (2/3)

What are Point Clouds?

- besides XYZ data, each point *p* can hold additional information
- examples include: RGB colors, intensity values, distances, segmentation results, etc

Motivation (1/5)

Why are Point Clouds important?

Point Clouds are important for a lot of reasons (!). Besides representing geometry, they can complement and supersede images when data has a high dimensionality.

PCL Examples

Acquisition (1/3)

How are Point Clouds acquired? Where do they come from?

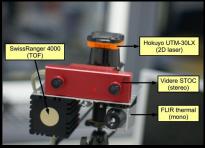

There are many different sensors that can generate 3D information. Examples:

- laser/lidar sensors (2D/3D)
- stereo cameras

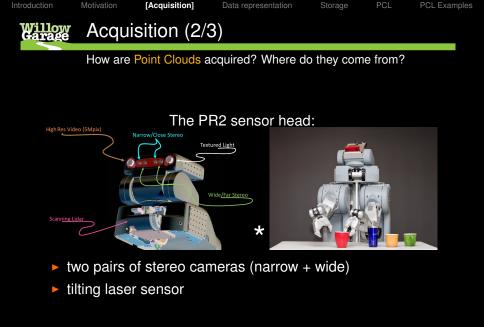

Motivation

- time-of-flight (TOF) cameras
- etc...

Radu Bogdan RUSU

Motivation [Acc

[Acquisition]

Data representation

Storage

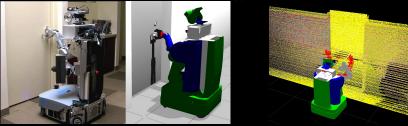

PCL Examples

Acquisition (3/3)

How are Point Clouds acquired? Where do they come from?

Simulation (!):

raytracing + stereo imagery fed into the same algorithmic modules that are used to process real data

Radu Bogdan RUSU

- 2. Motivation
- 3. Acquisition
- 4. Data representation
- 5. Storage
- 6. PCL

7. PCL Examples

As previously presented:

- ► a point \boldsymbol{p} is represented as an n-tuple, e.g., $\boldsymbol{p}_i = \{x_i, y_i, z_i, r_i, g_i, b_i, dist_i, \cdots\}$
- ▶ a Point Cloud *P* is represented as a collection of points *p_i*, e.g., *P* = {*p*₁, *p*₂, · · · , *p_i*, · · · , *p_n*}

Acquisition

[Data

[Data representation]

Storage

PCL Examples

Point Cloud Data structures

In terms of data structures:

- an XYZ point can be represented as:
 - float32 x
 float32 y
 float32 z

Motivation

► a n-dimensional point can be represented as:

float32[] point
which is nothing else but a:
std::vector<float32> point
in C++

potential problem: everything is represented as floats (!)

Acauisition

Motivation

[Data representation]

Storage

PCL Examples

Point Cloud Data structures

In terms of data structures:

• therefore a point cloud \mathcal{P} is: Point[] points or: std::vector<Point> points

in C++, where Point is the structure/data type representing a single point **p**

Radu Bogdan RUSU

Acauisition

Motivation

[Data representation]

Storage

PCL Examples

Point Cloud Data structures

Because Point Clouds are big:

- operations on them are typically slower (more data, more computations)
- they are expensive to store, especially if all data is represented as floats/doubles

Solutions:

Motivation

[Data representation]

PCL Examples

Point Cloud Data structures

Because Point Clouds are big:

- operations on them are typically slower (more data, more computations)
- they are expensive to store, especially if all data is represented as floats/doubles

Solutions:

- store each dimension data in different (the most appropriate) formats, e.g., rgb - 24bits, instead of 3×4 (sizeof float)
- group data together, and try to keep it aligned (e.g., 16bit for SSE) to speed up computations

Acquisition

PCL Examples

Data representation (7/7)

ROS representations for Point Cloud Data

- binary blobs are hard to work with
- we provide a custom converter, Publisher/Subscriber, transport tools, filters, etc, similar to images
- templated types: PointCloud2 —> PointCloud<PointT>
- examples of **PointT**:

```
struct PointXYZ
  float x:
  float v;
  float z;
struct Normal
  float normal[3];
  float curvature;
```

Point Cloud Library (1/10)

POINT CLOUD LIBRARY

http://pcl.ros.org/

Radu Bogdan RUSU

Motivation

[PCL]

Point Cloud Library (2/10)

What is PCL (Point Cloud Library)?

PCL is:

- fully templated modern C++ library for 3D point cloud processing
- uses SSE optimizations (Eigen backend) for fast computations on modern CPUs
- uses OpenMP and Intel TBB for parallelization
- passes data between modules (e.g., algorithms) using Boost shared pointers

PCL deprecates older ROS packages such as point_cloud_mapping and replaces sensor_msgs/PointCloud.msg with the modern sensor_msgs/PointCloud2.msg format (!)

Motivation

[PCL]

Point Cloud Library (3/10)

PCL (Point Cloud Library) structure

- collection of smaller, modular C++ libraries:
 - libpcl_features: many 3D features (e.g., normals and curvatures, boundary points, moment invariants, principal curvatures, Point Feature Histograms (PFH), Fast PFH, ...)
 - libpcl_surface: surface reconstruction techniques (e.g., meshing, convex hulls, Moving Least Squares, ...)
 - libpcl_filters: point cloud data filters (e.g., downsampling, outlier removal, indices extraction, projections, ...)
 - libpcl_io: I/O operations (e.g., writing to/reading from PCD (Point Cloud Data) and BAG files)
 - libpcl_segmentation: segmentation operations (e.g.,cluster extraction, Sample Consensus model fitting, polygonal prism extraction, ...)
 - libpcl_registration: point cloud registration methods (e.g., Iterative Closest Point (ICP), non linear optimizations, ...)
- unit tests, examples, tutorials (some are work in progress)

C++ classes are templated building blocks (nodelets!) Radu Bogdan RUSU Point Cloud Library

Motivation

PPG: Perception Processing Graphs

- Philosophy: write once, parameterize everywhere
- PPG: Perception Processing Graphs

Radu Bogdan RUSU

[PCL]

Point Cloud Library (5/10)

PPG: Perception Processing Graphs

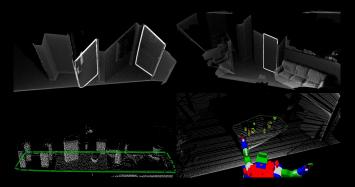

Why PPG?

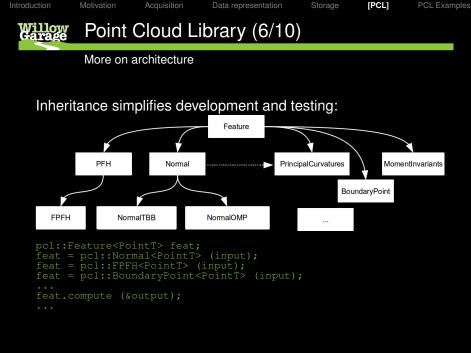

Algorithmically:

Motivation

door detection = table detection = wall detection = ...

the only thing that changes is: parameters (constraints)!

[PCL]

Point Cloud Library (7/10)

PCL 0.5 statistics

Misc, stats:

- ▶ 30 releases already $(0.1.x \rightarrow 0.5.x)$
- over 100 classes

Motivation

- over 60k lines of code (PCL, ROS interface, Visualization) in contrast, OpenCV trunk has 300k
- young library: only 10 months of development so far, but the algorithms and code bits have been around for 3-5 years
- external dependencies (for now) on eigen, cminpack, ANN, FLANN. TBB
- internal dependencies for PCL ROS: dynamic reconfigure message filters TF

Radu Bogdan RUSU

[PCL]

Point Cloud Library (8/10)

Nodelets

Motivation

- write once, parameterize everywhere \implies modular code
- ideally, each algorithm is a "building block" that consumes input(s) and produces some output(s)
- in ROS, this is what we call a node, inter-process data passing however is inefficient. ideally we need shared memory.

Solution:

```
nodelets = "nodes in nodes" = single-process, multi-threading
```

Point Cloud Library (8/10)

Nodelets

Motivation

- write once, parameterize everywhere \implies modular code
- ideally, each algorithm is a "building block" that consumes input(s) and produces some output(s)
- in ROS, this is what we call a node. inter-process data passing however is inefficient. ideally we need shared memory.

Solution:

nodelets = "nodes in nodes" = single-process, multi-threading

- same ROS API as nodes (subscribe, advertise, publish)
- dynamically (un)loadable
- optimizations for zero-copy Boost shared_ptr passing
- PCL nodelets use dynamic_reconfigure for on-the-fly parameter setting
