

Counterfactual Machine Learning

CS 7792 - Fall 2016

Thorsten Joachims

Department of Computer Science & Department of Information Science

Cornell University

Outline of Today

- Introduction
 - Thorsten Joachims
- Overview of Class Topics
 - Machine Learning with Humans in the Loop
 - Counterfactual Model and Machine Learning
 - Challenges
- Administrivia
 - Goals for the Class
 - Pre-Requisites
 - Credit Options and Format
 - Course Material
 - Contact Info

User Interactive Systems

Examples

- Search engines
- Entertainment media
- E-commerce
- Smart homes, robots, etc.

User Behavior as Data for

- Evaluating system performance
- Learning improved systems and gathering knowledge
- Personalization

Implicit Feedback in Web Search

- Observable actions
 - Queries / reformulations
 - Clicks
 - Order, dwell time
 - Etc.
- Implicit feedback
 - Personalized
 - Democratic
 - Timely
 - Cheap
 - Abundant

The screenshot shows a Yahoo! search results page for the query 'svm'. The browser is Windows Internet Explorer. The search bar contains 'svm' and the search button is labeled 'Search'. The results are displayed in a list format. The first result is 'Support vector machine - Wikipedia, the free encyclopedia', which is highlighted in blue. Other results include 'SVM E-Business Solutions', 'Symbol Lookup from Yahoo! Finance', 'SVM-Light Support Vector Machine', 'SVM.TO: Summary for SILVERCORP METALS INC - Yahoo! Finance', and 'SVM - Wikipedia, the free encyclopedia'. On the right side, there are sponsored results for 'GM Fleet Vehicles', 'Svm at Amazon.com', 'Sony SVM', 'Svm', and 'SVM Stock Information'. The page also shows navigation links like 'Web', 'Images', 'Video', 'Local', 'Shopping', and 'more'.

Which Ranking Function is Better?

Distribution $P(u,q)$
of users u , queries q

$(t_j, \text{"SVM"})$
 \vdots
 \vdots

Retrieval Function 1

$$f_1(u,q) \rightarrow r_1$$

Which one
is better?

Retrieval Function 2

$$f_2(u,q) \rightarrow r_2$$

$U(t_j, \text{"SVM"}, r_2)$

Measuring Utility

Name	Description	Aggregation	Hypothesized Change with Decreased Quality
Abandonment Rate	% of queries with no click	N/A	Increase
Reformulation Rate	% of queries that are followed by reformulation	N/A	Increase
Queries per Session	Session = no interruption of more than 30 minutes	Mean	Increase
Clicks per Query	Number of clicks	Mean	Decrease
Click@1	% of queries with clicks at position 1	N/A	Decrease
Max Reciprocal Rank*	1/rank for highest click	Mean	Decrease
Mean Reciprocal Rank*	Mean of 1/rank for all clicks	Mean	Decrease
Time to First Click*	Seconds before first click	Median	Increase
Time to Last Click*	Seconds before final click	Median	Decrease

(*) only queries with at least one click count

ArXiv.org: User Study

User Study in ArXiv.org

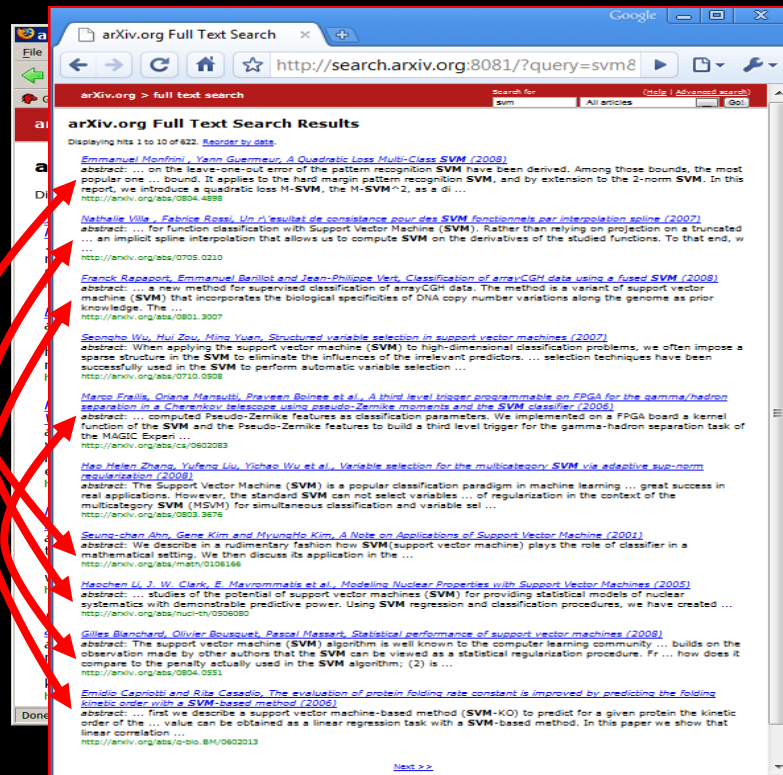

- Natural user and query population
- User in natural context, not lab
- Live and operational search engine
- Ground truth by construction

ORIG \succ SWAP2 \succ SWAP4

- ORIG: Hand-tuned fielded
- SWAP2: ORIG with 2 pairs swapped
- SWAP4: ORIG with 4 pairs swapped

ORIG \succ FLAT \succ RAND

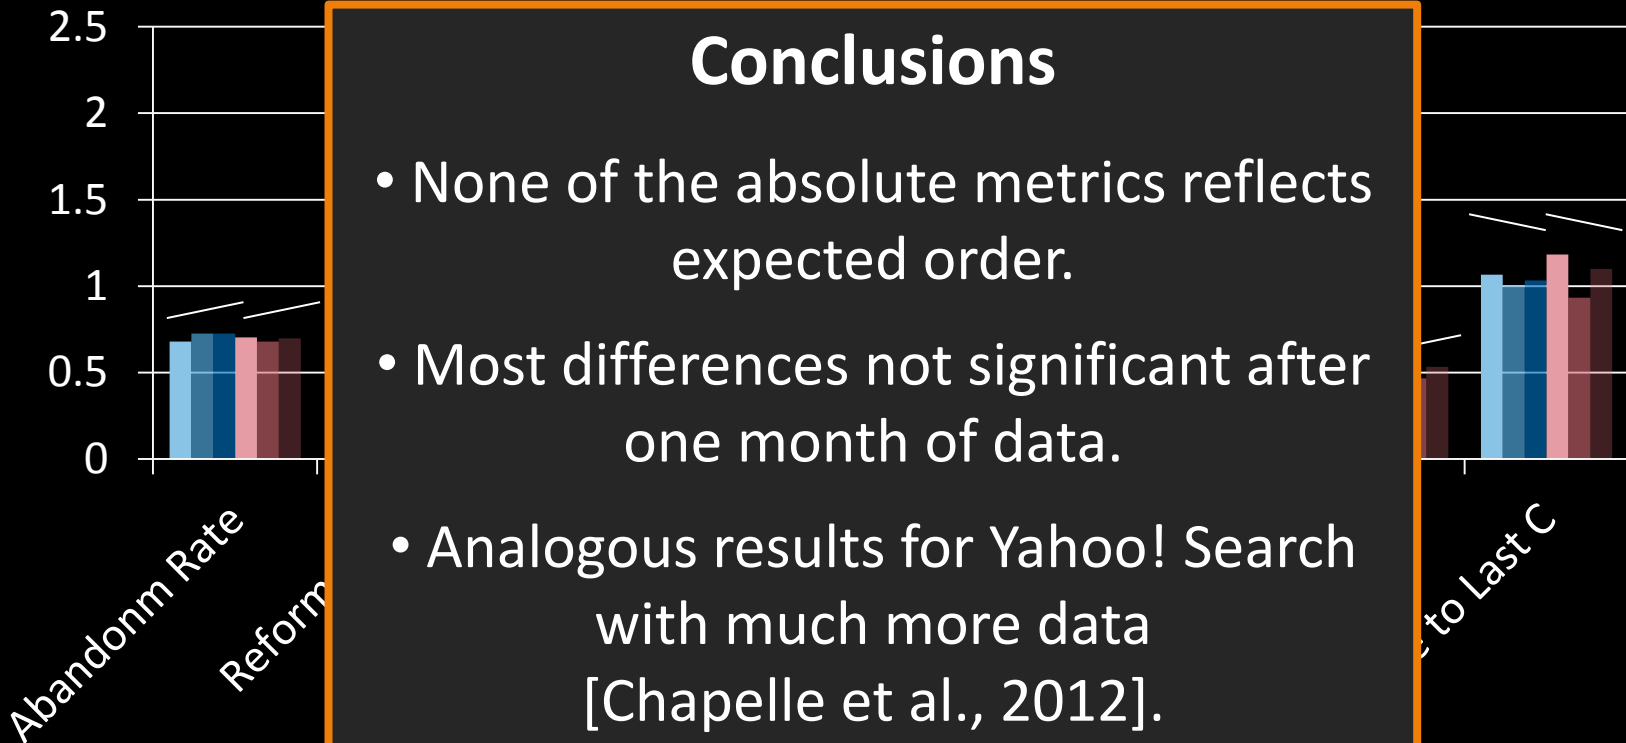

- ORIG: Hand-tuned fielded
- FLAT: No field weights
- RAND : Top 10 of FLAT shuffled

ArXiv.org: Experiment Setup

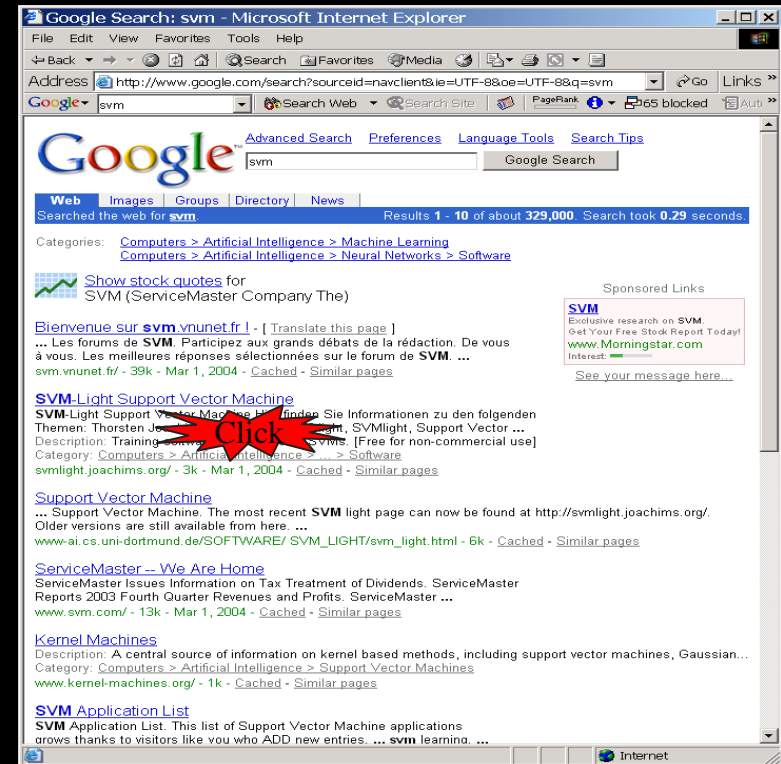

- Experiment Setup
 - Phase I: 36 days
 - Users randomly receive ranking from Orig, Flat, Rand
 - Phase II: 30 days
 - Users randomly receive ranking from Orig, Swap2, Swap4
 - User are permanently assigned to one experimental condition based on IP address and browser.
- Basic Statistics
 - ~700 queries per day / ~300 distinct users per day
- Quality Control and Data Cleaning
 - Test run for 32 days
 - Heuristics to identify bots and spammers
 - All evaluation code was written twice and cross-validated

Arxiv.org: Results

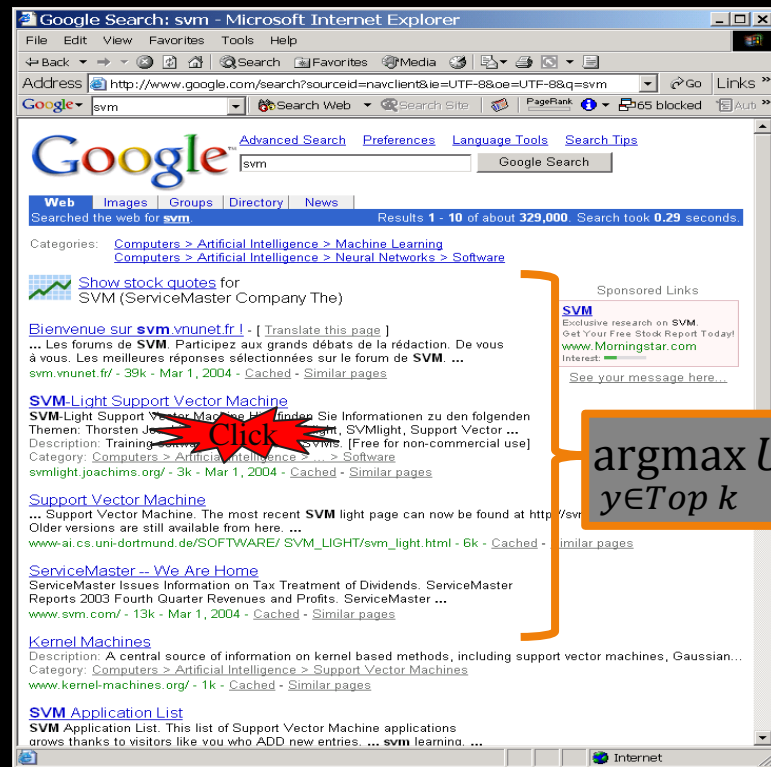

Economic Models of Decision Making

- Rational Choice
 - Alternatives Y
 - Utility function $U(y)$
 - Decision $\bar{y} = \operatorname{argmax}_{y \in Y} \{U(y)\}$
- Bounded Rationality
 - Time constraints
 - Computation constraints
 - Approximate $U(y)$
- Behavioral Economics
 - Framing
 - Fairness
 - Loss aversion

A Model of how Users Click in Search

- Model of clicking:
 - Users explore ranking to position k
 - Users click on most relevant (looking) links in top k
 - Users stop clicking when time budget up or other action more promising (e.g. reformulation)
 - Empirically supported by [Granka et al., 2004]

Balanced Interleaving

($u=tj, q="svm"$)

$f_1(u,q) \rightarrow r_1$

$f_2(u,q) \rightarrow r_2$

7. Lucent Technologies: SVM demo applet
<http://svm.research.bell-labs.com/SVT/SVMsvt.html>

Model of User:
Boundedly rational
choice among top k
observed results.

Invariant:
For all k , top k of
balanced interleaving is
union of top k_1 of r_1 and
top k_2 of r_2 with $k_1 = k_2 \pm 1$.

Interpretation: ($r_1 \succ r_2$) \Leftrightarrow clicks(top k (r_1)) > clicks(top k (r_2))

\rightarrow see also [Radlinski, Craswell, 2012] [Hofmann, 2012]

Arxiv.org: Interleaving Experiment

- Experiment Setup
 - Phase I: 36 days
 - Balanced Interleaving of (Orig,Flat) (Flat,Rand) (Orig,Rand)
 - Phase II: 30 days
 - Balanced Interleaving of (Orig,Swap2) (Swap2,Swap4) (Orig,Swap4)
- Quality Control and Data Cleaning
 - Same as for absolute metrics

Arxiv.org: Interleaving Results

Conclusions

- All interleaving experiments reflect the expected order.
- All differences are significant after one month of data.
 - Analogous findings for Bing [Radlinski & Craswell, 2010] and Yahoo! Search [Chapelle et al., 2012].

Using Behavior as Feedback

- Measuring User Satisfaction
 - Need behavioral model to get accurate training data out of biased feedback
 - Use experimental control to collect unbiased data
- Data comes from experiment, not omniscient teacher

Interactive Learning System

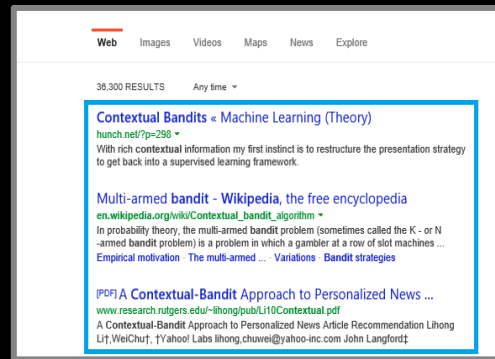

Context x

Feedback $\delta(x, y)$

Utility: $U(\pi_0)$

Action y for x

Ad Placement

- Context x :
 - User and page
- Action y :
 - Ad that is placed
- Feedback $\delta(x, y)$:
 - Click / no-click

The image shows a screenshot of a YouTube video player. The video title is "Frozen Let it Go - In Real Life" by "Working with Lemons". The video has 25,728,122 views and 69,983 likes. An orange box highlights an advertisement on the right side of the page. The ad is titled "MID-YEAR MARVEL DEALS." and lists travel deals for various cities: HO CHI MINH CITY (ECONOMY CLASS), KUALA LUMPUR (11,248,000), MELBOURNE (12,978,000), and AMSTERDAM (11,31,000). The ad also mentions "ALL-INCLUSIVE RETURN FARES FROM 1995" and "See more deals". Below the ad, there is a "Up next" section with several video thumbnails, including "Disney Frozen Videos - Elsa Toys In Giant Frozen Surprise Egg Opening", "Do You Want To Build a Snowman? - Frozen Cover Little Anna In Real Life", "Parody Let it Go - Not In Real Life", "When Will My Life Begin - In Real Life", "Love is an Open Door - in Real Life (Frozen Cover)", "Let It Go with 25 Disney Characters", and "[MMD] Frozen Elsa Y Anna - Libre soy - Dueto (Final alternativo)".

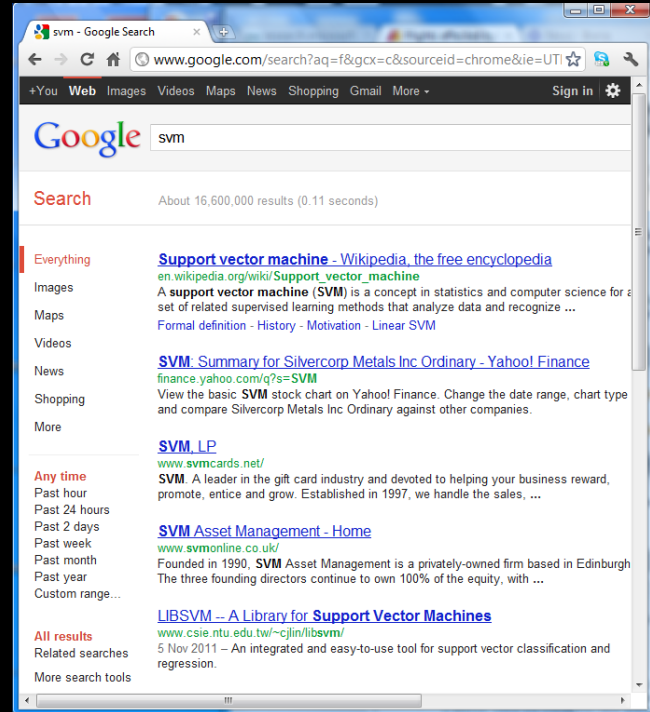

News Recommender

- Context x :
 - User
- Action y :
 - Portfolio of news articles
- Feedback $\delta(x, y)$:
 - Reading time in minutes

Search Engine

- Context x :
 - Query
- Action y :
 - Ranking
- Feedback $\delta(x, y)$:
 - win/loss against baseline in interleaving

Log Data from Interactive Systems

- Data

context

π_0 action

reward / loss

$$S = ((x_1, y_1, \delta_1), \dots, (x_n, y_n, \delta_n))$$

→ Partial Information (aka “Contextual Bandit”)
Feedback

- Properties

- Contexts x_i drawn i.i.d. from unknown $P(X)$
- Actions y_i selected by existing system $\pi_0: X \rightarrow Y$
- Feedback δ_i from unknown function $\delta: X \times Y \rightarrow \mathfrak{R}$

Learning from User Behavior

- Data dependent on system actions
 - Not full information, but partial information feedback
 - Data comes from experiments, not teacher
- Ability to run interactive experiments with users
 - Adaptive vs. stationary experiment control
 - Exploration/exploitation trade-offs
- Reusing existing log data
 - Observational vs. experimental data
 - Stochastic vs. deterministic logging systems

Overall Goals for this Class

- Deeply explore one active research area in ML.
 - Batch Learning from Bandit Feedback
 - Learning under selection bias and MNAR data
 - ML algorithms based in counterfactual model
 - Behavioral feedback models

→ Incredibly narrow focus.
 - Practice being a successful academic
- Class targeted towards current PhD students with research interests in this area!

Pre-Requisites

- This is not an introductory Machine Learning class!
- You need to satisfy one of the following ML pre-reqs:
 - Successfully taken CS4780 “Machine Learning”
 - Successfully taken CS6780 “Advanced Machine Learning”
 - Successfully taken a comparable “Intro to ML” class (*)
 - Acquired the equivalent ML knowledge in some other way (e.g. strong background in Statistics + ML textbook) (*)
- Currently doing or planning to do research in this area of ML
- Basic probability, basic statistics, general mathematical maturity

(*) means talk to me

Format of Class

- Lectures (by TJ)
 - Background material
- Research paper presentations (by students)
 - Explore current state of the art
- Peer reviewing

Research Paper Presentations

- Students present the paper in class
 - Slide presentation
 - Create critique, extended bibliography, examples, demo software, experiments etc. that help understand the paper
 - Prepare discussion topics / group activity
 - Prepare quiz
- Everybody reads the paper in preparation for class
 - Quiz about each paper
- All students give feedback afterwards.

Credit Options and Grades

- Pass/Fail: Need to get at least 50% of points on each of following to pass.
 - paper presentation
 - in-class quizzes (lowest grades replaced by second lowest grade)
 - peer reviewing (lowest grades replaced by second lowest grade)
 - in-class participation
- Letter grade:
 - not allowed
- Audit:
 - not allowed, unless you have very good arguments
