

Interlude

Why Object Oriented Programming?

Announcements for This Lecture

This Week

- Today is an **Interlude**
 - **Nothing today is on exam**
 - “Big Picture” lecture; may still be very helpful to you
- Thursday is **Recursion**
 - Hardest topic in course
 - But will try to make it easy
 - Be there or be LOST
- Then the class gets easier...

Announcements

- Assignment 1 Resubmissions
 - 181 out of 195 have a 10
 - Today is absolute last day
- Assignment 2 is graded
 - Solution posted in CMS
 - Mean 12.8/15; Median 13
- Assignment 3 due today
 - Turn in by Midnight
 - Will be graded by weekend

A Short History of Programming: First Generation

A Short History of Programming: Assembly Language

```
.data # start of data

x:
    .long    1
    .long    5
    .long    2
    .long    18

sum:
    .long    0

.text # start of code

.globl _start
```

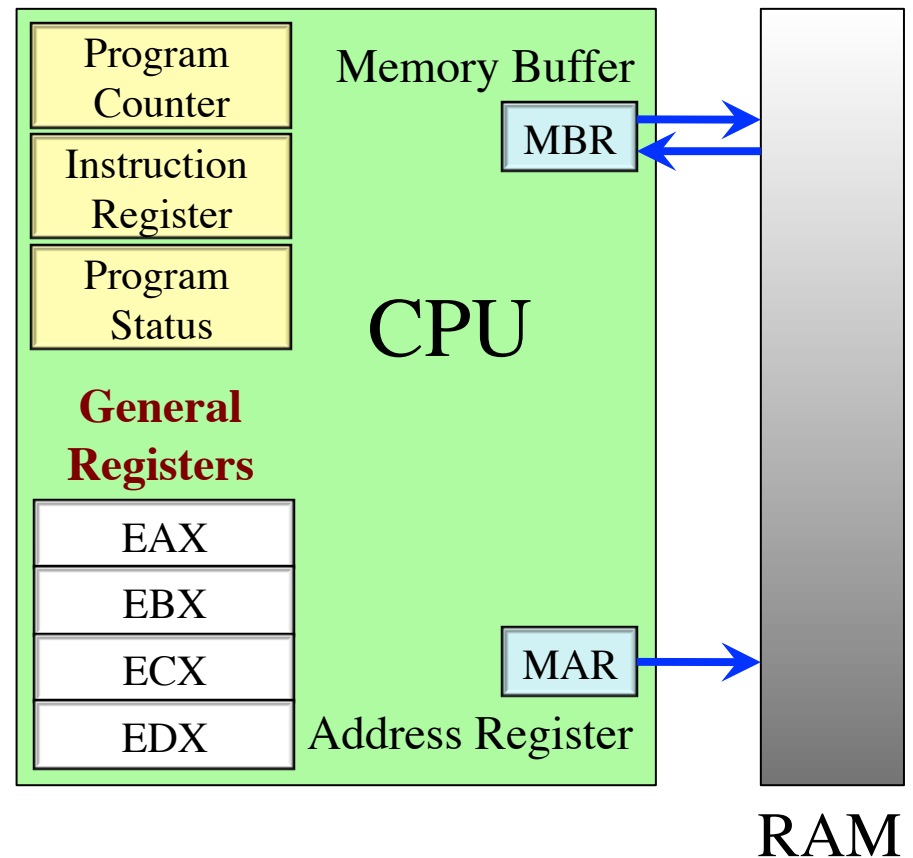

```
_start:
    movl $4, %eax # EAX is counter
                    # for number of
                    # words to sum
    movl $0, %ebx # EBX stores sum
    movl $x, %ecx # ECX points to
                    # next item to sum

top:
    addl (%ecx), %ebx
    addl $4, %ecx # move to next
    decl %eax    # decr. counter
    jnz top     # if counter not
                    # 0, then loop

done:
    movl %ebx, sum # done, store
                    # result in "sum"
```

A Short History of Programming: Assembly Language

- Commands correspond to machine instructions
 - Close to machine language (no need to compile)
 - Programming “on the iron”
- Lot of load/store commands
 - `movl` from previous slide
 - **Registers** hold the data (like a variable)
 - Moving between RAM and registers is tedious
- Hard to write large programs

“High Level” Languages

- Language that is abstracted from the computer
 - Working with a **metaphor**, not **on the iron**
 - “Folders” are actually a **metaphor of a metaphor**
- Compiles (or translates) to assembly
 - And then down to pure machine language
 - One high-level line may be many lines of assembly
- Today there are many languages to choose from
 - We cannot agree on which metaphors are best
 - A lot of CS is **coming up with these metaphors**

A Short History of Programming: BASIC

```
10 INPUT "What is your name: ", U$
20 PRINT "Hello "; U$
30 INPUT "How many stars do you want ", N
40 S$ = ""
50 FOR I = 1 TO N
60 S$ = S$ + "*"
70 NEXT I
80 PRINT S$
90 INPUT "Do you want more stars? ", A$
100 IF LEN(A$) = 0 THEN GOTO 90
110 A$ = LEFT$(A$, 1)
120 IF A$ = "Y" OR A$ = "y" THEN GOTO 30
130 PRINT "Goodbye "; U$
140 END
```

Very complex in assembly

- Draw String on monitor
- Wait for keyboard input
- Convert input to String
- Put String in variable U\$

A Short History of Programming: BASIC

- **The Metaphor**

- Commands have line numbers
- Process the lines in order
- GOTO, NEXT statements can jump forward or back

- Made programming easy!

- On every computer in 80s
- Primary hobbyist language

- But code was **monolithic**

- Use a single number ordering
- Code all fits in a single “file”
- Large programs still hard

```
10 REM Sample BASIC Program
20 REM Counts To Ten
30 REM
40 PRINT "I am a BASIC program"
50 PRINT "that counts to ten."
60 PRINT
70 FOR I=1 TO 10
80 PRINT I
90 NEXT I
100 PRINT
110 PRINT "Thanks for running me."
120 END
```

Computer Game Development

```
Forms FORM-29827281-12:
Test Assessment Report

This was a triumph.
I'm making a note here:
HUGE SUCCESS.
It's hard to overstate
my satisfaction.
Aperture Science
We do what we must
because we can.
For the good of all of us.
Except the ones who are dead.

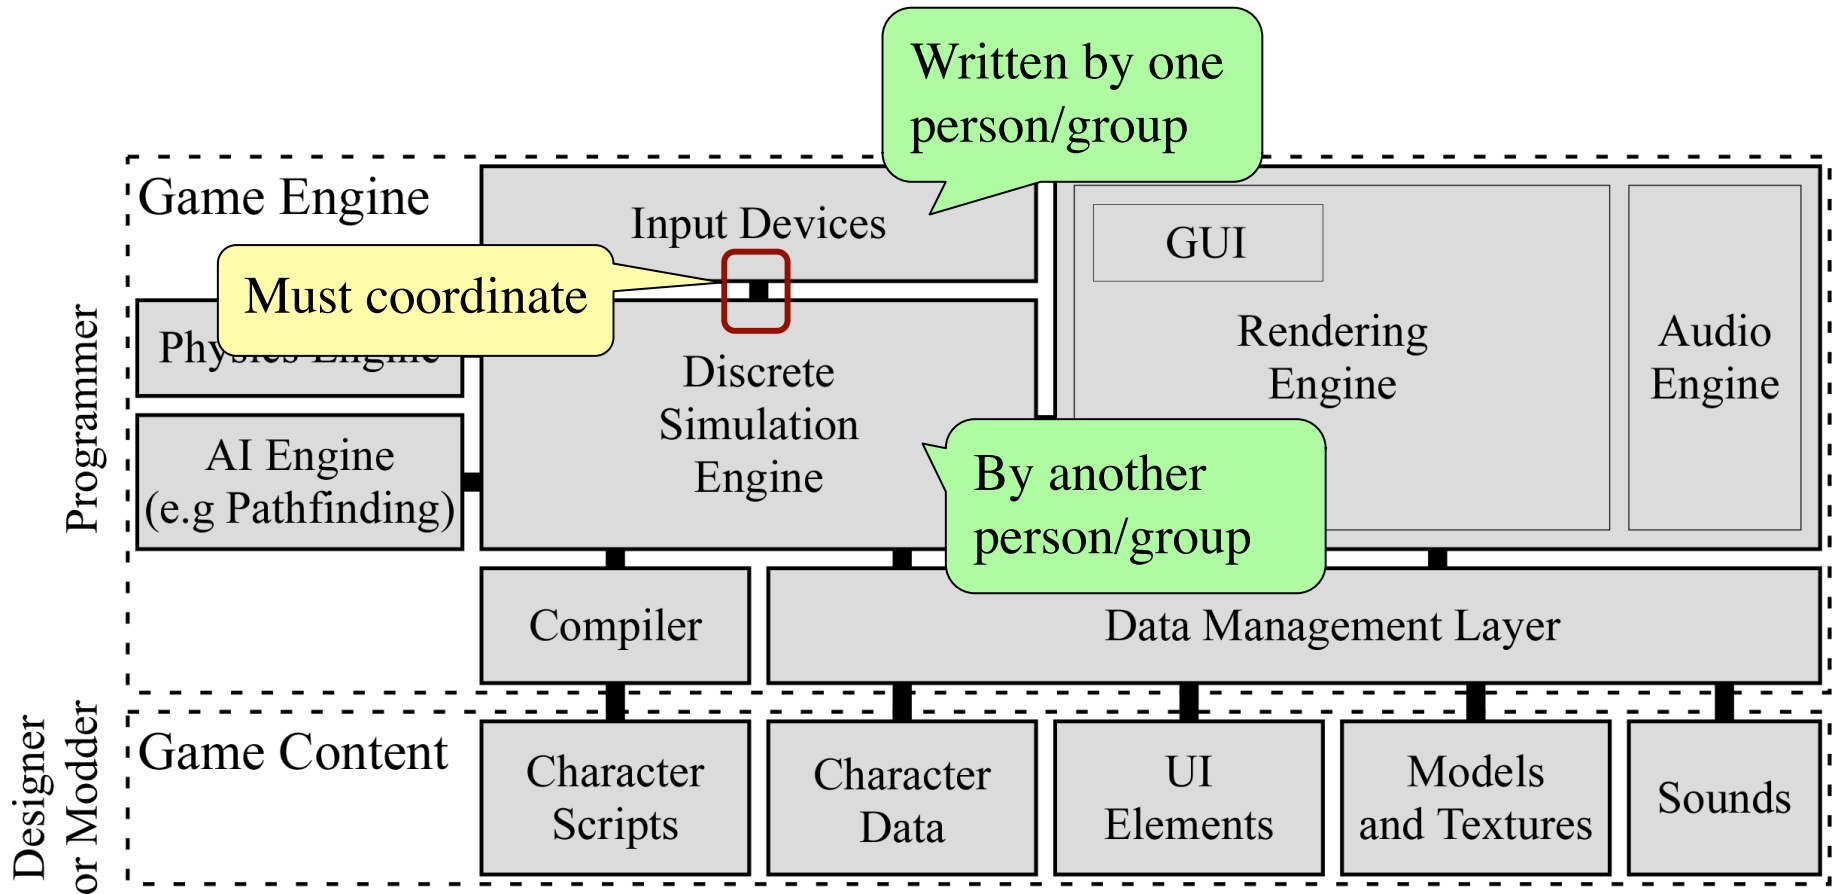

But there's no sense crying
over every mistake.
You just keep on trying
till you run out of cake.
And the Science gets done.
And you make a neat gun.
For the people who are
still alive.

Challenge: Breaking Up Software

A Short History of Programming: C (and its descendants)

```
int main() {
    int var1 = 1;
    int var2 = 2;
    printf("max(%d,%d)=%d",
        var1, var2,
        max(var1,var2));

    exit 0;
}
```

```
int max(int a, int b) {
    if (a > b) {
        return a;
    }
    return b;
}
```

A Short History of Programming: C (and its descendants)

- **The Metaphor**

- Organized via **functions** (with side-effects)
- **Procedures**: functions that return a value of type void
- Function declarations can spread over multiple files

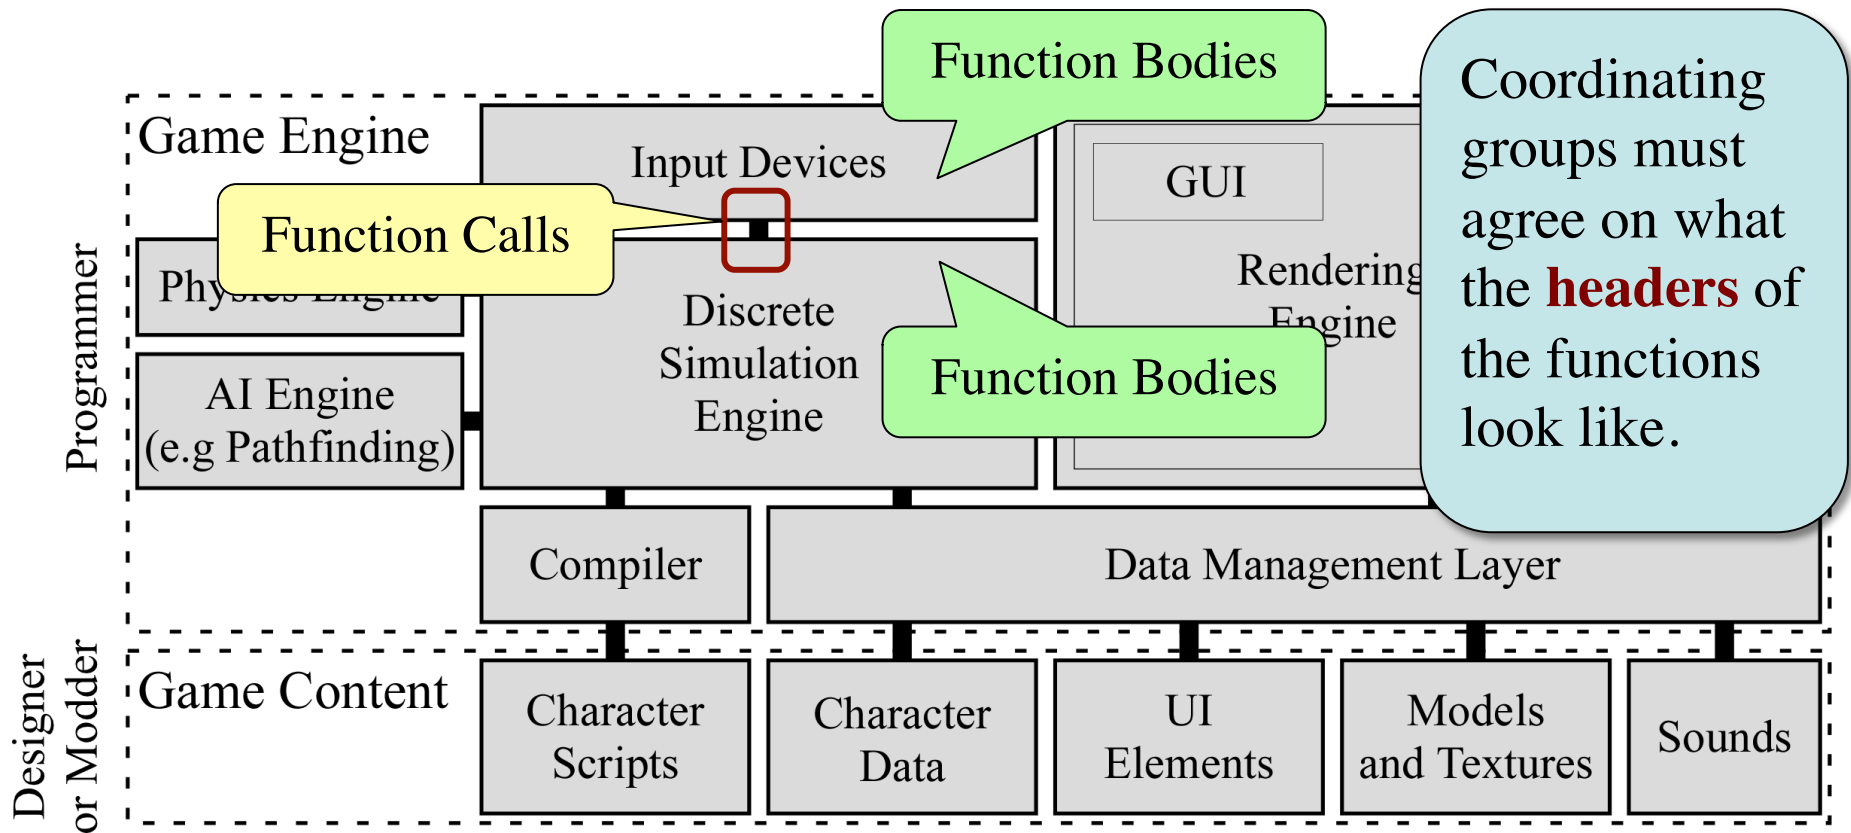

- Supports **modularity**

- Each programmer works to define a function (or many)
- Can *call* a function made by another programmer

```
int max(int a, int b) {  
    if (a > b) {  
        return a;  
    }  
    return b;  
}
```

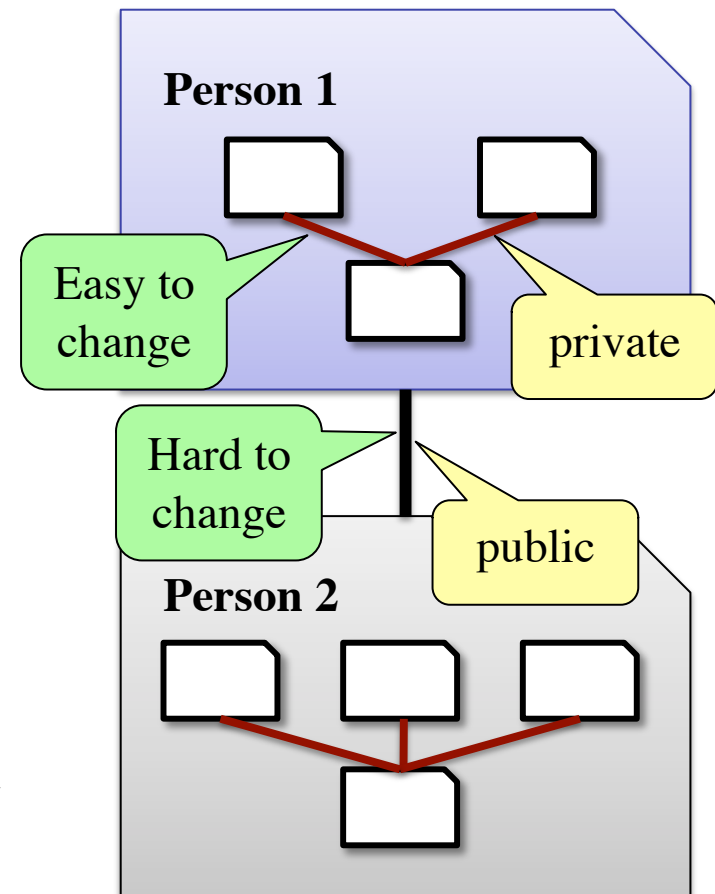

C is like programming in Java,
but only using static methods

Challenge: Breaking Up Software

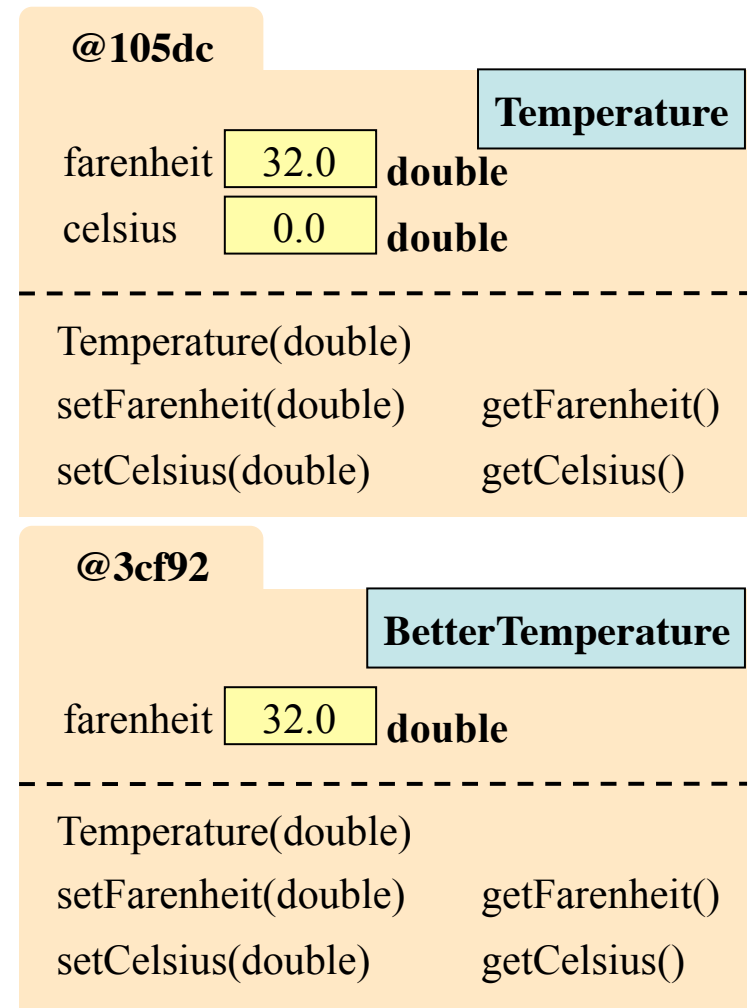

Encapsulation: Reducing Dependencies

- Development is iterative
 - You are always making changes (to improve your software)
- Coordination hurts iteration
 - Others are calling your functions
 - If you change your functions work, their code may no longer work
 - **Example:** Our test code in A1
- **Encapsulation:** limit what the other programmers can access in your code
 - If cannot access, changes are okay

Encapsulation is the Primary Purpose of Object Oriented Programming

- Encapsulation applies to both code and data!
 - Data in JFrame is hidden
 - Could you tell if it was changed in later versions?
- Encapsulation in Java
 - Make all data private
 - Force data access through the methods (getters/setters)
- Public methods: **the interface**
 - Not allowed to change the interface without permission

Object Oriented Descendants of C

Direct Descendants

- **C++**
 - Optional OO features for C; a superset of C language
 - High performance language
 - But kludgy and messy
- **Objective-C**
 - Also superset of C language
 - Trades performance for collaboration features
 - Used in OS X, iPhone

“Cousin” Languages

- **Java**
 - “Reimagining” of C++
 - Fixes a lot of the problems
 - A little easier for beginners
 - Compile one, run anywhere
 - Ideal language for the web
 - Others are platform specific
- **C#**
 - “Reimagining” of Java
 - Microsoft specific language

Java for Beginners: Challenges

Advantages

- Very useful language
 - Can make professional-quality programs
 - Standard language for web
- Works on any platform (OS X, Windows, mobile)
- Easier than many alternatives
 - C++ too hard for beginners
 - Others not as powerful

Disadvantages

- The C influence is showing
 - types, functions, void
 - Designed for people who learned the other languages
- Too much to learn at start
 - Cannot program without learning classes/objects first
 - Lots of mysterious keywords

Java for Beginners: Challenges

Advantages

- Very useful language
 - Can make professional-quality programs
 - Standard
- Works on (OS X, Windows)
- Easier than many alternatives
 - C++ too hard for beginners
 - Others not as powerful

Disadvantages

- The C influence is showing
 - Cannot program without learning classes/objects first
 - Lots of mysterious keywords

What We Really Want:

- Language with modern OO features
- As easy to pick up as BASIC was

A Short History of Programming: Is Python Best for Beginners?

- **The Metaphor**

- Mainly functions (like C)
- Classes and objects exist, but are all optional
- No distinction between the “interactions pane” and file

- An **untyped** language

- Language checks the types for you automatically
- Both a plus and a minus

- CS 1110 starting this Fall

```
def greet(name):  
    print 'Hello', name
```

```
greet('Jack')  
greet('Jill')  
greet('Bob')
```
