

### MVC in this Course

Model	Controller
<ul style="list-style-type: none"> <li><b>A3:</b> Color classes                             <ul style="list-style-type: none"> <li>RGB, CMYK &amp; HSV</li> </ul> </li> <li><b>A4:</b> Turtle, Pen                             <ul style="list-style-type: none"> <li>Window is <b>View</b></li> </ul> </li> <li><b>A5:</b> Database, Cluster                             <ul style="list-style-type: none"> <li>Data is always in model</li> </ul> </li> <li><b>A6:</b> Ball, Brick, etc..                             <ul style="list-style-type: none"> <li>All shapes/geometry</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li><b>A3:</b> a3app.py                             <ul style="list-style-type: none"> <li>Hidden classes</li> </ul> </li> <li><b>A4:</b> Functions in a4.py                             <ul style="list-style-type: none"> <li>No need for classes</li> </ul> </li> <li><b>A5:</b> best_cluster                             <ul style="list-style-type: none"> <li>But visualizer is a class</li> </ul> </li> <li><b>A6:</b> Breakout                             <ul style="list-style-type: none"> <li>Controller class for you!</li> </ul> </li> </ul>

### Must We Write this Loop Each Time?

```

while program_is_running:
    # Get information from mouse/keyboard
    # Handled by OS/GUI libraries

    # Your code gets here
    controller.doloop()

    # Handled by OS/GUI libraries
    
```

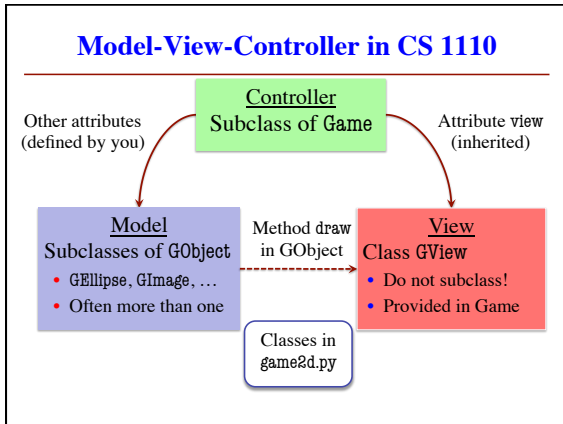

Method call (for loop body)

- Write loop body in a controller.
- OS/GUI handles everything else.

Controller object in the screen

### Loop Invariants Revisited

Normal Loops	Controller
<pre> x = 0 i = 2 # x = sum of squares of 2..i while i &lt;= 5:     x = x + i*i     i = i + 1 # x = sum of squares of 2..5                     </pre> <p>Properties of "external" vars</p>	<p>What are the "external" vars?</p> <pre> while program_running:     # Get input     # Your code called here     controller.doloop()     # Draw                     </pre> <p>controller is an object. It will have <b>attributes!</b></p>

### Attribute Invariants = Loop Invariants

- Attributes are a way to store value between calls
  - Not part of call frame
  - Variables outside loop
- A controller needs
  - Loop attributes
  - Initialization method (for loop, not `__init__`)
  - Method for body of loop
- Attribute descriptions, invariants are important

```

game = Game(...) #constructor
...
game.init() #Loop initialization
# inv: game attributes are ...
while program_running:
    # Get input
    # Your code goes here
    game.update(time_elapsed)
    game.draw()
# post: game attributes are ...
    
```

### Example: Animation

```

class Animation(Game):
    """Application to an animation"""
    def init(self):
        """Special loop initialization method"""
        ...
    def update(self, dt):
        """Change the ellipse position"""
        ...
    def draw(self):
        """Draw the ellipse"""
        ...
    
```

Annotations:

- `class Animation(Game):`: Parent class that does hard stuff (See animation.py)
- `def init(self):`: Loop initialization (Do NOT use `__init__`)
- `def update(self, dt):`: Loop body
- `def draw(self):`: Use method `draw()` defined in `GObject`

### What Attributes to Keep: Touch

- Attribute `touch` in `GView`
  - The mouse press position
  - Or `None` if not pressed
  - Use `self.view.touch` inside controller (`Game`) methods
- Compare `touch`, `last` position
  - `last None, touch not None`: Mouse button **pressed**
  - `last not None, touch None`: Mouse button **released**
  - `last and touch not None`: Mouse **dragged** (button down)

### More Attributes: Checking Click Types

- Double click = 2 fast clicks
- Count number of fast clicks
  - Add an attribute `clicks`
  - Reset to 0 if not fast enough
- Time click speed
  - Add an attribute `time`
  - Set to 0 when mouse released
  - Increment when not pressed (e.g. in loop method `update()`)
  - Check `time` when next pressed

### State: Changing What the Loop Does

- State**: Current loop activity
  - Playing game vs. pausing
  - Ball countdown vs. serve
- Add an attribute `state`
  - Method `update()` checks state
  - Executes correct helper
- How do we store state?
  - State is an *enumeration*; one of several fixed values
  - Implemented as an int
  - Global **constants** are values
