

Lists: Sequences of Objects

String	List
<ul style="list-style-type: none"> <code>s = 'abc de'</code> <pre> 0 1 2 3 4 5 a b c d e </pre>	<ul style="list-style-type: none"> <code>x = [5, 6, 8, 9, 15, 23]</code> <pre> 0 1 2 3 4 5 5 6 8 9 15 23 </pre>
<ul style="list-style-type: none"> Put characters in quotes <ul style="list-style-type: none"> Use <code>\</code> for quote character Access characters with <code>[]</code> <ul style="list-style-type: none"> <code>s[0]</code> is 'a' <code>s[8]</code> causes an error <code>s[0:2]</code> is 'ab' (excludes 2nd b) <code>s[2:]</code> is 'c de' 	<ul style="list-style-type: none"> Put items inside <code>[]</code> <ul style="list-style-type: none"> Separate by commas Access items with <code>[]</code> <ul style="list-style-type: none"> <code>x[0]</code> is 5 <code>x[8]</code> causes an error <code>x[0:2]</code> is [5, 6] (excludes 2nd 5) <code>x[3:]</code> is [8, 9, 15, 23]

Difference: Lists Hold Any Type

```

0 1 2 3 4 5
5 6 8 9 15 23
                    
```

 a list of integers

```

0 1 2 3 4 5 6
'H' 'e' 'l' 'o' ' ' 'World'
                    
```

 a list of strings

```

0 1 2 3 4
id1 id2 id5 id4 id3
                    
```

 a list of objects of class Point

```

0 1 2 3 4 5 6 7
5 'a' 'joy' 24.3 id1 id3 0 id2
                    
```

 a heterogeneous list

id1 id2 id3 id4 id5
 Point Point Point Point Point

Lists vs. Objects With Attributes

List	Point
<ul style="list-style-type: none"> Attributes are indexed <ul style="list-style-type: none"> Example: <code>a[2]</code> 	<ul style="list-style-type: none"> Attributes are named <ul style="list-style-type: none"> Example: <code>p.x</code>
<pre> a id6 id6 0 1 2 3 4 5 6 7 1 2 3 3 4 5 6 8 </pre>	<pre> p id7 Point x 3.0 y 4.0 z 5.0 </pre>

Things that Work for All Sequences

<code>s = 'slithy'</code>	<code>x = [5, 6, 9, 6, 15, 5]</code>	the smallest <i>i</i> for which <code>x[i] == 5</code>
<code>s.index('s') → 0</code>	<code>x.index(5) → 0</code>	
<code>s.count('t') → 1</code>	<code>x.count(6) → 2</code>	the number of <i>is</i> for which <code>x[i] == 6</code>
<code>len(s) → 6</code>	<code>len(x) → 6</code>	
<code>s[4] → "h"</code>	<code>x[4] → 15</code>	
<code>s[1:3] → "li"</code>	<code>x[1:3] → [6, 9]</code>	
<code>s[3:] → "thy"</code>	<code>x[3:] → [6, 15, 5]</code>	
<code>s[-2] → "h"</code>	<code>x[-2] → 15</code>	
<code>s + ' toves' → "slithy toves"</code>	<code>x + [1, 2] → [5, 6, 9, 6, 15, 5, 1, 2]</code>	
<code>s * 2 → "slithyslithy"</code>	<code>x * 2 → [5, 6, 9, 6, 15, 5, 6, 9, 6, 15, 5]</code>	

Difference: Lists are mutable

- Their contents **can be altered**
 - by assignment to list items

```

x = [5, 7, 3, 1]
x[1] = 8
                            
```
 - using methods

```

x.append(2)
x.extend([3, 4])
x.insert(5, 6)
x.sort()
                            
```
- Draw lists as folders
 - because they are mutable objects
 - can omit type to save space

See Python Standard Library for more methods

Does not work for strings

```

s = 'Hello World!'
s[0] = 'J' ERROR
s.append('?') ERROR
        
```

Clicker Exercise

<ul style="list-style-type: none"> Execute the following: <pre> >>> x = [5, 6, 5, 9, 10] >>> x[3] = -1 >>> x.insert(1, 2) </pre> What is <code>x[4]</code>? 	<ul style="list-style-type: none"> Execute the following: <pre> >>> x = [5, 6, 5, 9, 10] >>> y = x >>> y[1] = 7 </pre> What is <code>x[1]</code>?
<p>A: 10 B: 9 C: -1 D: ERROR E: I don't know</p>	<p>A: 7 B: 5 C: 6 D: ERROR E: I don't know</p>

Lists and Functions: Swap

```
def swap(b, h, k):
    """Procedure swaps b[h] and b[k] in b
    Precondition: b is a mutable list, h
    and k are valid positions in the list"""
    1 temp= b[h]
    2 b[h]= b[k]
    3 b[k]= temp
```

Swaps b[h] and b[k], because parameter b contains name of list.

swap(x, 3, 4)

x [id7]
 id7
 0 1 2 3 4 5 6 7
 3 4 1 9 5 3 2 0

swap: ~~xxx~~
 b [id7] h [3] k [4]
 temp [5]

Slicing Lists Makes Copies

x = [5, 6, 5, Point(3,4,5)] y = x[1:3]

id8 x [id8]
 id9 y [id9]

id7 Point
 x [3.0]
 y [4.0]
 z [5.0]

id10 z [id10]

Clicker Exercise

- Execute the following:
 >>> x = [5, 6, 5, 9, 10]
 >>> y = x[1:]
 >>> y[0] = 7
 - Execute the following:
 >>> x = [5, Point(1, 2, 3), 6]
 >>> y = x[1:]
 >>> y[0].x = 7
- What is x[1]?
- A: 7
 B: 5
 C: 6
 D: **ERROR**
 E: I don't know
- What is x[1].x?
- A: 1
 B: 5
 C: 7
 D: **ERROR**
 E: I don't know

Lists and Strings: They go together like...

text.split(sep): return a list of the words in text (separated by sep, or whitespace by default)

sep.join(words): concatenate the items in the list of strings words, separated by sep.

```
text = 'Rama lama lama \nke ding a de ding a dong'
words = text.split()
lines = text.split('\n')
sep = '\n'
print sep.join(words)
s = (sep.join(lines[0].split()) + ' ' + sep.join(lines[1].split()))
```

returns a list of two strings

['Rama', 'lama', 'lama', 'ke', ...]

'Rama-lama-lama-ke...'

'Rama-lama-lama ke-ding-a-de-ding-a-dong'

...a horse and carriage? Bread and butter?

Tuples

- Tuples fall between strings and lists
 - write them with just commas: 42, 4.0, 'x' (length 1: (42,) length 0: ())
 - often enclosed in parentheses: (42, 4.0, 'x')
- Conventionally use lists for:
- long sequences
 - homogeneous sequences
 - variable length sequences
- Conventionally use tuples for:
- short sequences
 - heterogeneous sequences
 - fixed length sequences
