CS1110

Lecture 10: More with Sequences

Announcements

Assignment 2
Hand it in today by leaving it on the table in front.

Reading
…for next week:
Sections 5.8-5.10

Slides by D. Gries, L. Lee, S. Marschner, W. White

Processing lists: builtins

- `sum(x)` adds up all the elements in the list `x`
  - they had better be numbers!
- `min(x)` or `max(x)` find the minimum resp. maximum value in the list `x`
  - they use the same ordering as sort()
- `range(`*n*`)` produces [0, 1, 2, …, *n*–1]
  - optional arguments to start somewhere other than zero
- `list(x)` converts `x` (a string for example) to a list
  - e.g. `list('mimsy')` produces [“m”, “i”, “m”, “s”, “y”]

Processing lists: The map Function

General form: map(⟨*function*⟩, ⟨*list*⟩)

if x is a list of *n* items and
f is a function with one parameter:

map(f, x)

[f(x[0]), f(x[1]), ..., f(x[*n*–1])]

if x is a list of *n* items and
m is a method with no parameters:

map(m, x)

[x[0].m(), x[1].m(), ..., x[*n*–1].m()]

calls the function once for each list item

examples:

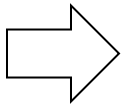
map(len, ['a', 'bc', 'defg']) produces [1, 2, 4]
map(str.strip, ['a ', ' bc', ' defg ']) produces [“a”, “bc”, “defg”]

Processing lists: The for Statement

General form:

for ⟨*variable*⟩ in ⟨*list*⟩:
    ⟨*statements*⟩

```
for a in x:
    print 3 * a
```



```
print 3 * x[0]
print 3 * x[1]
print 3 * x[2]
...
print 3 * x[n–1]
```

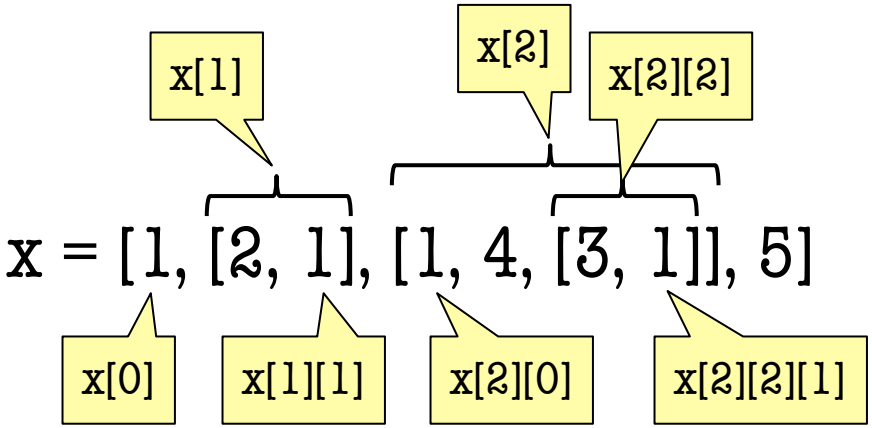
executes the body once for each list item

when the body is executed, the value of a is the current list item

Nested Lists

- Lists can hold any objects
- Lists are objects
- Therefore lists can hold other lists!

```
a = [2, 1]
b = [3, 1]
c = [1, 4, b]
x = [1, a, c, 5]
```



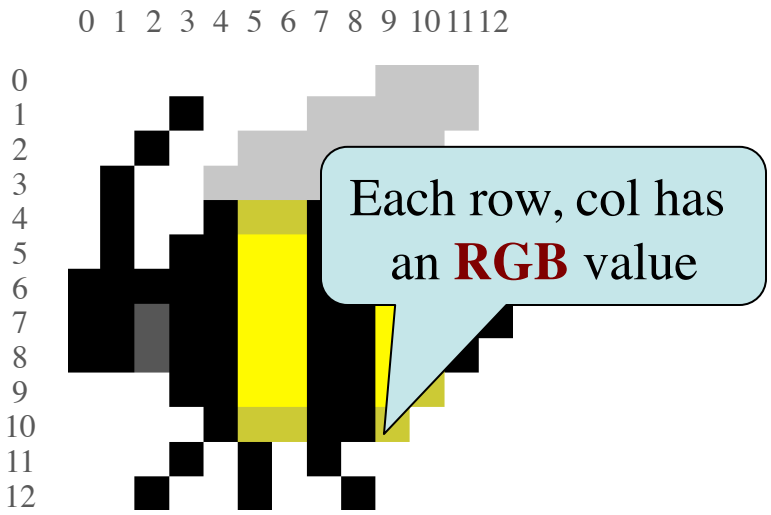
Two Dimensional Lists

Table of Data

	0	1	2	3
0	5	4	7	3
1	4	8	9	7
2	5	1	2	3
3	4	1	2	9
4	6	7	8	0

Each row, col has a value

Images



Store them as lists of lists (**row-major order**)

```
d =  [[5,4,7,3],[4,8,9,7],[5,1,2,3],[4,1,2,9],[6,7,8,0]]
```

Overview of Two-Dimensional Lists

- Access value at row 3, col 2:

  `d[3][2]`

- Assign value at row 3, col 2:

  `d[3][2] = 8`

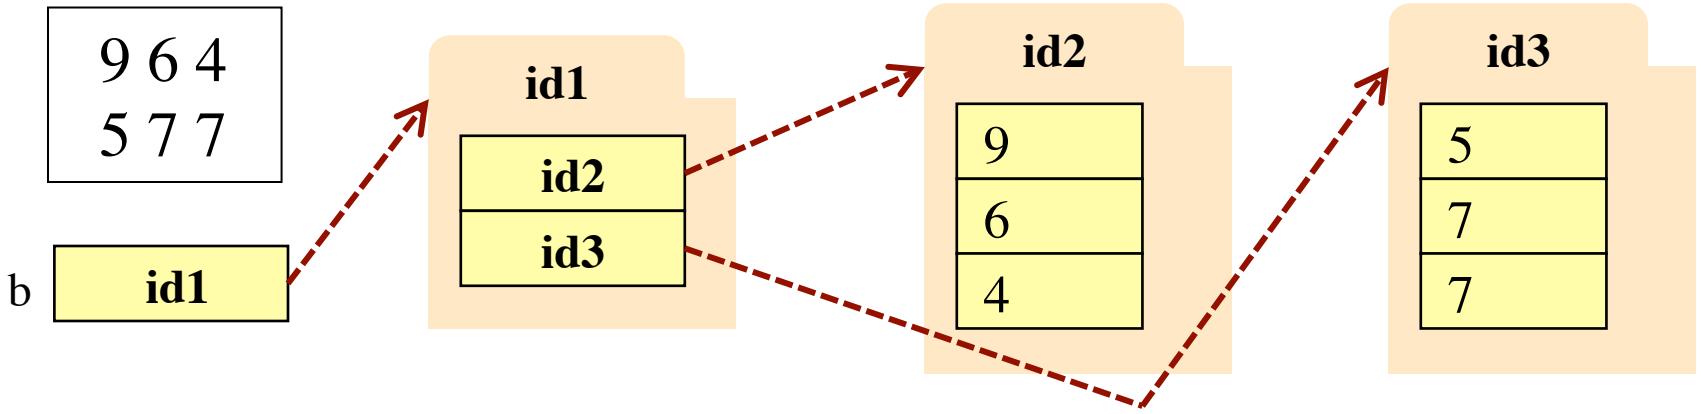
- Getting array dimensions:
  - Number of rows of d: `len(d)`
  - Number of cols in row r of d: `len(d[r])`

`d`

	0	1	2	3
0	5	4	7	3
1	4	8	9	7
2	5	1	2	3
3	4	1	2	9
4	6	7	8	0

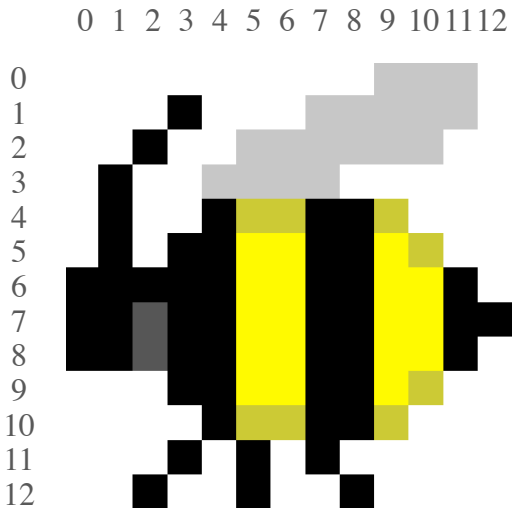
How Multidimensional Lists are Stored

- b = [[9, 6, 4], [5, 7, 7]]

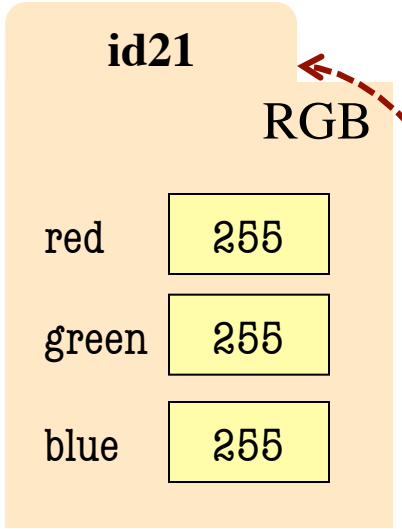


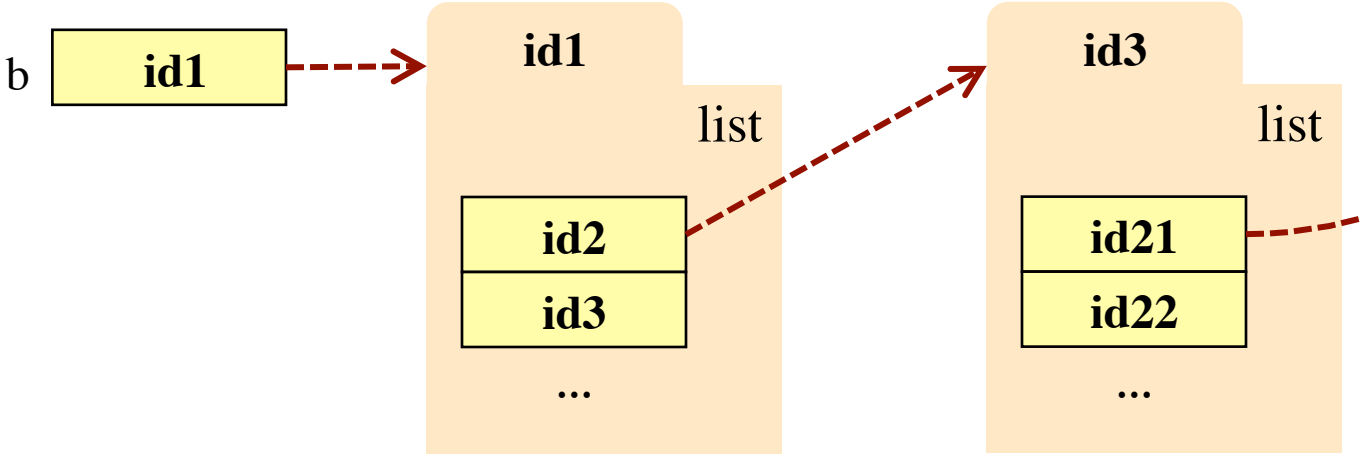
- b holds name of a one-dimensional list
  - Has len(b) elements
  - Its elements are (the names of) 1D lists
- b[i] holds the name of a one-dimensional list (of ints)
  - Has len(b[i]) elements

Image Data: 2D Lists of Pixels



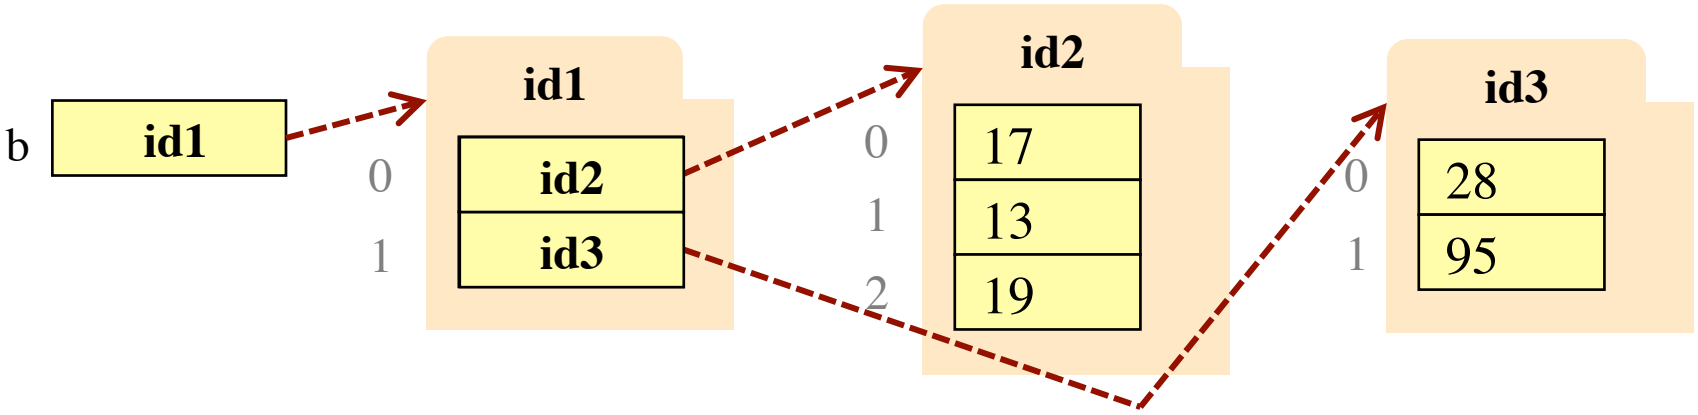
b[0][0] is a white pixel





Ragged Lists: Rows w/ Different Length

- `b = [[17,13,19],[28,95]]`

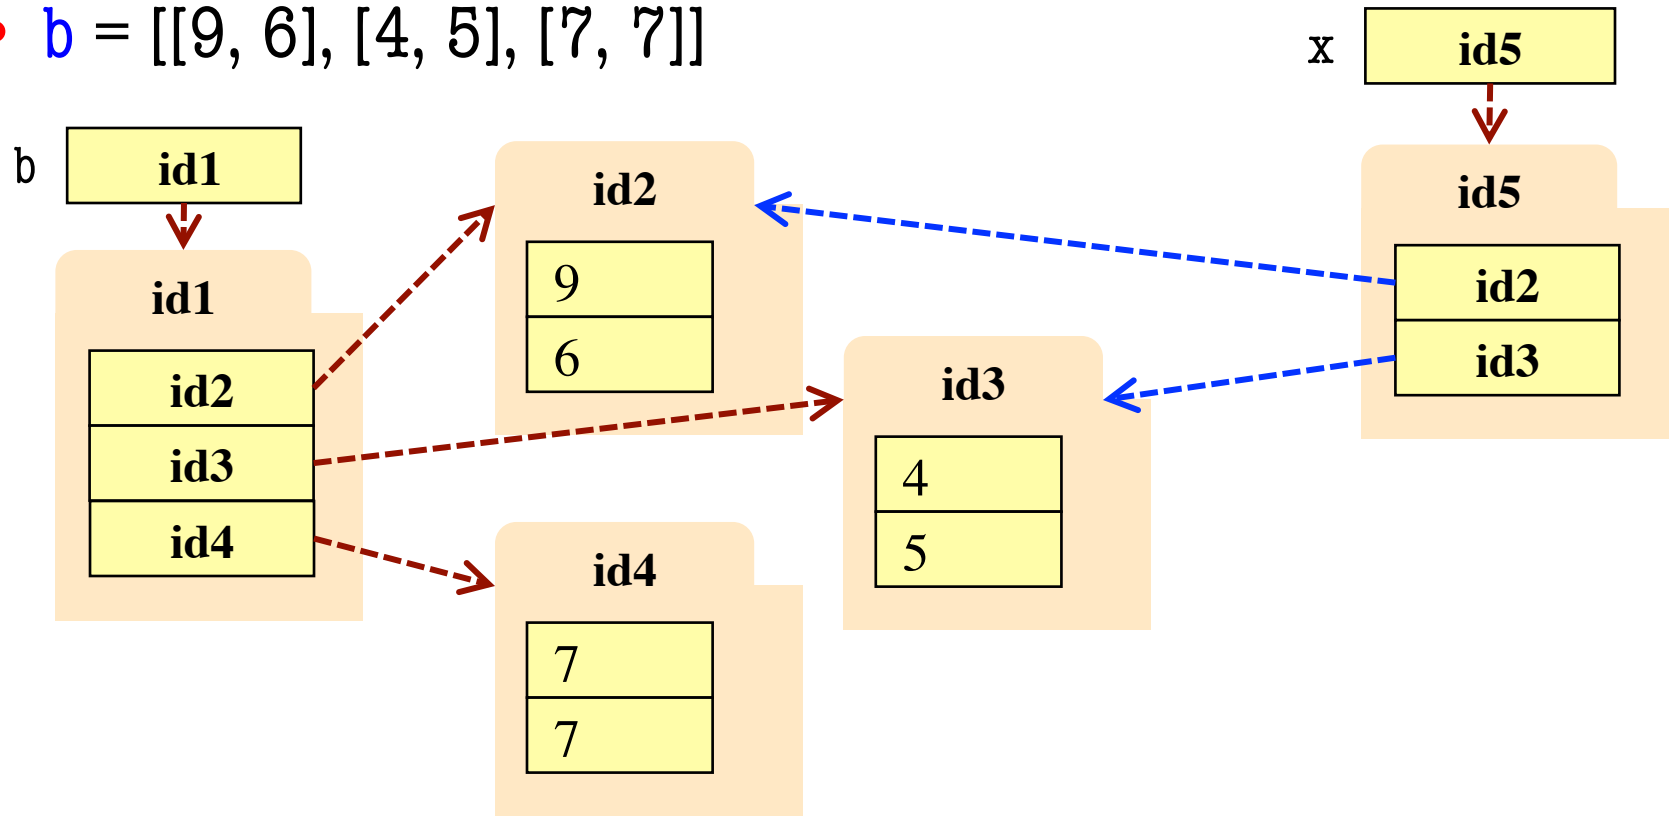


- Will see applications of this later

Slices and Multidimensional Lists

- Only “top-level” list is copied.
- Contents of the list are not altered
- `b` = [[9, 6], [4, 5], [7, 7]]

`x = b[:2]`



Slices and Multidimensional Lists

- Create a 2D List

```
>>> b = [[9,6],[4,5],[7,7]]
```

- Get a slice

```
>>> x = b[:2]
```

- Append to a row of `x`

```
>>> x[1].append(10)
```

- `x` now has the 2D list

```
[[9, 6], [4, 5, 10]]
```

- What are the contents of the list (with name) in `b`?

A: [[9,6],[4,5],[7,7]]
B: [[9,6],[4,5,10]]
C: [[9,6],[4,5,10],[7,7]]
D: [[9,6],[4,10],[7,7]]
E: I don't know
