

Recall: Horizontal Notation

Example of an assertion about an sequence b. It asserts that:

1. $b[0..k-1]$ is sorted (i.e. its values are in ascending order)
2. Everything in $b[0..k-1]$ is \leq everything in $b[k..len(b)-1]$

Given index h of the first element of a segment and index k of the element that follows that segment, the number of values in the segment is $k - h$.

$$(h+1) - h = 1$$

$b[h .. k - 1]$ has $k - h$ elements in it.

Partition Algorithm Implementation

```
def partition(b, h, k):
    """Partition list b[h..k] around a pivot x = b[h]"""
    i = h; j = k+1; x = b[h]
    # invariant: b[h..i-1] < x, b[i] = x, b[j..k] >= x
    while i < j-1:
        if b[i+1] >= x:
            # Move to end of block.
            _swap(b,i+1,j-1)
            j -= 1
        else: # b[i+1] < x
            _swap(b,i+1)
            i += 1
    # post: b[h..i-1] < x, b[i] is x, and b[i+1..k] >= x
    return i
```

<= x	x	?	>= x
h	i	i+1	j
1 2	3	1 5 0	6 3 8

Partition Algorithm Implementation

```
def partition(b, h, k):
    """Partition list b[h..k] around a pivot x = b[h]"""
    i = h; j = k+1; x = b[h]
    # invariant: b[h..i-1] < x, b[i] = x, b[j..k] >= x
    while i < j-1:
        if b[i+1] >= x:
            # Move to end of block.
            _swap(b,i+1,j-1)
            j -= 1
        else: # b[i+1] < x
            _swap(b,i+1)
            i += 1
    # post: b[h..i-1] < x, b[i] is x, and b[i+1..k] >= x
    return i
```

Dutch National Flag Variant

- Sequence of integer values
 - ‘red’ = negatives, ‘white’ = 0, ‘blues’ = positive
 - Only rearrange part of the list, not all

pre: t =h,
i =k+1,
j =k
post: t =i

Dutch National Flag Algorithm

```
def dnf(b, h, k):
    """Returns partition points as a tuple (i,j)"""
    t = h; i = k+1; j = k;
    # inv: b[h..t-1] < 0, b[t..j-1] ?, b[j..l] = 0, b[l..k] > 0
    if t < k:
        if b[t] < 0:
            swap(b,t,t)
            t += 1
        elif b[t] == 0:
            i = t
        else:
            swap(b,t,j)
            i = t; j = j-1
    # post: b[h..i-1] < 0, b[i..j] = 0, b[j..k] > 0
    return (i,j)
```

Dutch National Flag Algorithm

```
def dnf(b, h, k):
    """Returns partition points as a tuple (i,j)"""
    t = h; i = k+1; j = k;
    # inv: b[h..t-1] < 0, b[t..j-1] ?, b[j..l] = 0, b[l..k] > 0
    while t < k:
        if b[t] < 0:
            swap(b,t,t)
            t += 1
        elif b[t] == 0:
            i = t
        else:
            swap(b,t,j)
            i = t; j = j-1
    # post: b[h..i-1] < 0, b[i..j] = 0, b[j..k] > 0
    return (i,j)
```

Flag of Mauritius

- Now we have four colors!
- Negatives: 'red' = odd, 'purple' = even
- Positives: 'yellow' = odd, 'green' = even

pre:	b	h	?	k			
post:	b	< 0 odd	< 0 even	≥ 0 odd	≥ 0 even		
inv:	b	h	r	s	i	t	k

Flag of Mauritius

$< 0, o$	$< 0, e$	$\geq 0, o$	$\geq 0, e$?	$\geq 0, e$						
h	r	s	i	?	t						
-1	-3	-2	-4	7	5	-5	6	1	0	2	4

h	r	s	i	t	k						
-1	-3	-5	-4	2	5	7	-6	1	0	2	4

Need two swaps
for two spaces

Flag of Mauritius

$< 0, o$	$< 0, e$	$\geq 0, o$	$\geq 0, e$?	$\geq 0, e$						
h	r	s	i	?	t						
-1	-3	-2	-4	7	5	-5	6	1	0	2	4
h	r	s	i	t	k						
-1	-3	-5	-4	2	5	7	-6	1	0	2	4

See algorithms.py
for Python code

Linear Search

h	?	k
pre: b		
post: b	v not here	?
OR		
inv: b	v not here	

Linear Search

```
def linear_search(b,c,h):
    """Returns: first occurrence of c in b[h..]"""
    # Store in i the index of the first c in b[h..]
    i = h

    # invariant: c is not in b[0..i]
    while i < len(b) and b[i] != c:
        i = i + 1

    # post: c is not in b[h..i]
    if i >= len(b) or b[i] == c:
        return i if i < len(b) else -1
```

Analyzing the Loop

- Does the initialization make **inv** true?
- Is **post** true when **inv** is true and **condition** is false?
- Does the repetend make progress?
- Does the repetend keep the invariant **inv** true?

Binary Search

- Vague:** Look for **v** in **sorted** sequence segment **b[h..k]**.
- Better:**

▪ **Precondition:** $b[h..k]$ is sorted (in ascending order).

▪ **Postcondition:** $b[h..i] \leq v \text{ and } v < b[i+1..k]$

- Below, the array is in non-descending order:

h	?	k	
pre: b			
h	i	k	
post: b	$\leq v$	$> v$	
h	i	j	
inv: b	$< v$?	$> v$

Called **binary search**
because each iteration
of the loop cuts the
array segment still to
be processed in half
