5. Introduction to Procedures

Topics:
- The module SimpleGraphics
- Creating and Showing figures
- Drawing Rectangles, Disks, and Stars
- Optional arguments
- Application Scripts

Procedures

We continue our introduction to functions with a focus on procedures.

Procedures are functions that do not return a value.

Instead, they "do something."

Graphics is a good place to illustrate the idea.

The Module SimpleGraphics Has Eight Procedures

- MakeWindow
- ShowWindow
- DrawRect
- DrawDisk
- DrawStar
- DrawLineSeg
- DrawText
- Title

Examples

We will use this module to make designs that involve rectangles, disks, stars, etc.

Examples

Looks like we will be able to draw tilted rectangles

Example

How does color work?

What if we had 100 rows each with 100 stars?

Example

Xeno's Paradox: Will we ever reach the right edge?
Let's write a function to draw this:

And then apply it two times:

After We Learn About Iteration...

What if there were billions and billions of stars? Will need loops.

After We Learn About Iteration...

How long before the square is covered? Need loops.

A Quick Tour Through the SimpleGraphics Module

We now show how to use the eight procedures in SimpleGraphics:

- MakeWindow
- ShowWindow
- DrawRect
- DrawDisk
- DrawStar
- DrawLineSeg
- DrawText
- Title

Each of these procedures has several "options." We do not cover everything in the lecture slides. Labs and demo scripts cover these procedures in greater detail.

Random Mondrian. Repeatedly cut a rectangle into 4 smaller rectangles.
First: Create a Figure Window

You cannot create any designs until you have a figure into which you can "drop" rectangles, disks, and stars.

MakeWindow

```
from SimpleGraphics import *
n = 5
MakeWindow(n)
```

Here we have created a figure with labeled axes that is ready to display things in the square defined by 

\[-5 \leq x \leq 5, -5 \leq y \leq 5\]

MakeWindow

```
from SimpleGraphics import *
n = 5
MakeWindow(n, bgcolor=PURPLE)
```

The "default" is to "paint" the figure window white. So this is what you must do to set the background color to something different.

MakeWindow

```
from SimpleGraphics import *
n = 5
MakeWindow(n, labels=False)
```

The "default" is to label the axes. So this is what you must do to suppress the labeling.

Color in simpleGraphics

The module has thirteen "built-in" colors.

If a SimpleGraphics procedure wants a color, just "hand over" one of these:

- YELLOW
- PURPLE
- CYAN
- ORANGE
- RED
- BLUE
- GREEN
- MAGENTA
- PINK
- WHITE
- BLACK
- LIGHTGRAY
- DARKGRAY

There is more flexibility than this. More later.

MakeWindow

```
from SimpleGraphics import *
n = 5
MakeWindow(n, labels=False, bgcolor=ORANGE)
```

You can turn off labeling and specify a color in the same call to MakeWindow.
Optional Arguments

The function `MakeWindow` has four arguments.

Three of the arguments are "optional".

When there are several optional arguments, their order is immaterial. These are equivalent:

```
MakeWindow(n, labels=False, bgcolor=ORANGE)
MakeWindow(n, bgcolor=ORANGE, labels=False)
```

Note: You need the "assignment" for an optional argument. This is illegal:

```
MakeWindow(5, False, ORANGE)
```

Let's Draw a Rectangle with `DrawRect`

You must tell `DrawRect`
- the center of the rectangle.
- the horizontal dimension of the rectangle
- the vertical dimension of the rectangle

You have the option of telling `DrawRect`
- the fill color
- the width of the perimeter highlight
- the color of the perimeter highlight
- the rotation angle

```
from SimpleGraphics import*
MakeWindow(5, bgcolor=YELLOW)
x=0; y=0; L=5; W=3
DrawRect(x, y, L, W)
ShowWindow()
```

The default is a rectangle with no fill color. So all you get is the perimeter.

```
from SimpleGraphics import*
MakeWindow(5, bgcolor=YELLOW)
x=0; y=0; L=5; W=3
DrawRect(x, y, L, W, FillColor=MAGENTA)
ShowWindow()
```

Use the optional color argument to specify a fill color.

```
from SimpleGraphics import*
MakeWindow(5, bgcolor=YELLOW)
x=0; y=0; L=5; W=3
DrawRect(x, y, L, W, FillColor=MAGENTA, EdgeWidth=6)
ShowWindow()
```

Use the optional `EdgeWidth` argument to specify the boldness of the perimeter highlight. The default is `EdgeWidth = 1`.

```
from SimpleGraphics import*
MakeWindow(5, bgcolor=YELLOW)
x=0; y=0; L=5; W=3
DrawRect(x, y, L, W, FillColor=MAGENTA, EdgeWidth=6)
ShowWindow()
```

Use the optional `theta` argument to specify the counterclockwise rotation of the rectangle about its center. (Angle in degrees.)

The default rotation angle is zero.

```
from SimpleGraphics import*
MakeWindow(5, bgcolor=YELLOW)
x=0; y=0; L=5; W=3
DrawRect(x, y, L, W, color=MAGENTA, theta=30)
ShowWindow()
```

If you don't want any perimeter highlight, set `EdgeWidth=0`.

The default rotation angle is zero.
Let's Write a Script to Do This

The squares are 9x9, 7x7, 5x5, 3x3, and 1x1.

Nested Squares

DrawRect(0,0,9,9,FillColor=MAGENTA, EdgeWidth=10)

DrawRect(0,0,7,7,FillColor=CYAN, EdgeWidth=8)

DrawRect(0,0,5,5,FillColor=YELLOW, EdgeWidth=6)

DrawRect(0,0,3,3,FillColor=PURPLE, EdgeWidth=4)

DrawRect(0,0,1,1,EdgeWidth=5)
Nested Squares

```python
MakeWindow(6, bgcolor=WHITE)
DrawRect(0, 0, 9, 9, FillColor=MAGENTA, EdgeWidth=10)
DrawRect(0, 0, 7, 7, FillColor=CYAN, EdgeWidth=8)
DrawRect(0, 0, 5, 5, FillColor=YELLOW, EdgeWidth=6)
DrawRect(0, 0, 3, 3, FillColor=PURPLE, EdgeWidth=4)
DrawRect(0, 0, 1, 1, EdgeWidth=5)
ShowWindow()
```

Let's Draw a Disk with DrawDisk

```python
from SimpleGraphics import*
MakeWindow(5, bgcolor=WHITE)
DrawDisk(x=0, y=0, r=4)
ShowWindow()
```

DrawDisk

```python
from SimpleGraphics import*
MakeWindow(5, bgcolor=WHITE)
x=0; y=0; r=4
DrawDisk(x,y,r)
ShowWindow()
```

The default is a circle with no fill color. So all you get is the perimeter.

Let's Draw This

```python
from SimpleGraphics import*
MakeWindow(5, bgcolor=WHITE)
x=0; y=0; r=4
DrawDisk(x,y,r, FillColor=MAGENTA, EdgeWidth=6)
ShowWindow()
```

Use the optional EdgeWidth argument to specify the boldness of the perimeter highlight. The default is EdgeWidth = 1

If you don't want any perimeter highlight, set EdgeWidth=0.
1/22/2016

**Draw the First Disk**

\[ x = -4 \]
\[ r = 4 \]
\[
\text{DrawDisk}(x,0,r,\text{FillColor}=\text{MAGENTA}, \text{EdgeWidth}=0)
\]

**Draw the Second Disk**

\[ x = x + 1.5 \times r \]
\[ r = r/2 \]
\[
\text{DrawDisk}(x,0,r,\text{FillColor}=\text{CYAN}, \text{EdgeWidth}=0)
\]

**Draw the Third Disk**

\[ x = x + 1.5 \times r \]
\[ r = r/2 \]
\[
\text{DrawDisk}(x,0,r,\text{FillColor}=\text{MAGENTA}, \text{EdgeWidth}=0)
\]

**Overall**

\[ x = -4; \ r = 4 \]
\[
\text{DrawDisk}(x,0,r,\text{FillColor}=\text{MAGENTA}, \text{EdgeWidth}=0)
\]
\[ x = x + 1.5 \times r; \ r = r/2 \]
\[
\text{DrawDisk}(x,0,r,\text{FillColor}=\text{CYAN}, \text{EdgeWidth}=0)
\]
\[ x = x + 1.5 \times r; \ r = r/2 \]
\[
\text{DrawDisk}(x,0,r,\text{FillColor}=\text{MAGENTA}, \text{EdgeWidth}=0)
\]
\[ x = x + 1.5 \times r; \ r = r/2 \]
\[
\text{DrawDisk}(x,0,r,\text{FillColor}=\text{CYAN}, \text{EdgeWidth}=0)
\]

Notice the repetition of the \( x \) and \( r \) updates. Simpler than figuring the centers and radii "by hand". Also gets us ready for loops.

**Let’s Draw a Star with DrawStar**

You must tell `DrawStar`
- the center of the star.
- the radius of the star

You have the option of telling `DrawStar`
- the fill color
- the width of the perimeter highlight
- the color of the perimeter highlight
- the rotation angle

**DrawStar**

```python
from SimpleGraphics import*
MakeWindow(5, bgcolor=WHITE)
x=0; y=0; r=4
DrawStar(x,y,r)
ShowWindow()
```

The default is a star with no fill color. So all you get is the perimeter.

Note: the radius of a star is the distance from its center to any tip.
from SimpleGraphics import*
MakeWindow(5,bgcolor=YELLOW)
x=0; y=0; r=4
DrawStar(x,y,r,FillColor=MAGENTA)
ShowWindow()

Use the optional color argument to specify a fill color.

from SimpleGraphics import*
MakeWindow(5,bgcolor=YELLOW)
x=0; y=0; r=4
DrawStar(x,y,r,FillColor=MAGENTA,EdgeWidth=6)
ShowWindow()

Use the optional Edgeweight argument to specify the boldness of the perimeter highlight. The default is Edgeweight = 1. If you don't want any perimeter highlight, then set Edgeweight=0

from SimpleGraphics import*
MakeWindow(5,bgcolor=YELLOW)
x=0; y=0; r=4
DrawStar(x,y,r,FillColor=MAGENTA,theta=18)
ShowWindow()

Use the optional theta argument to specify the counterclockwise rotation of the rectangle about its center. (Angle in degrees.) The default rotation angle is zero.

from SimpleGraphics import*
MakeWindow(5,bgcolor=YELLOW)
a = -3; b = -2; c = 4; d = 2
DrawLineSeg(a,b,c,d,LineWidth=4,
            LineColor='MAGENTA')
ShowWindow()

The default line color is BLACK.
The default line width is 1.

from SimpleGraphics import*
MakeWindow(5,bgcolor=YELLOW)

a = -3; b = -2; c = 4; d = 2
DrawLineSeg(a,b,c,d,LineWidth=4,
            LineColor='MAGENTA')
ShowWindow()

The default line color is BLACK.
The default line width is 1.

Let's Draw a Line Segment with DrawLineSeg
You must tell DrawLineSeg
- the first endpoint of the segment
- the second endpoint of the segment
You have the option of telling DrawLineSeg
- the color of the segment
- the line width of the segment

Let's “Draw” Text with DrawText
You must tell DrawText
- the location of the text.
- the text (a string) that is to be displayed
You have the option of telling DrawText
- the color of the text
- the size of the font
```python
from SimpleGraphics import *
MakeWindow(3, bgcolor=YELLOW)
x=0; y=0; s = 'This is the origin.'
DrawText(x, y, s, FontSize=24, FontColor='MAGENTA')
DrawDisk(0, 0, .03, FillColor=BLACK)
ShowWindow()
```

The default text color is BLACK.
The default font size is 10.
The lower left corner of the first character is roughly at (x,y).

```
from SimpleGraphics import *
MakeWindow(5, bgcolor=YELLOW)
x=0; y=0; L=5; W=3
DrawRect(x, y, L, W, FillColor=MAGENTA)
ShowWindow()
```

When a module is imported, it gives access to both its functions and its global variables.
**rgb Lists**

Things like \[0.74,1.00,0.34\] are called rgb lists.

Rules: Square brackets, 3 numbers separated by commas, each number between 0 and 1.

First number = red value
Second number = green value
Third number = blue value

The bigger numbers mean more of that color.

---

**Using rgb Lists**

Instead of using the predefined colors you can make up and use your own fill color, e.g.

```python
c = [0.74,1.00,0.34]
DrawDisk(0,0,1,Fillcolor=c)
```

Google "rgb values" to look at huge tables of colors and rgb values.

---

**Title**

```python
from SimpleGraphics import*
r=0.8, g=0.4, b=0.8
MakeWindow(5,bgcolor=[r,g,b])
s = 'r=%4.2f  g=%4.2f  b=%4.2f' % (r,g,b)
Title(s,FontSize=20)
ShowWindow()
```

You can put a title at the top of the figure window.

---

**A Note on Managing Figures**

Three figure windows will be produced.

The green code defines what is in the first window.

The pink and blue code set up the second and third windows.

The `ShowWindow` says, "Show all the windows."

---

**A Final Example**

Shows two things.

1. You can write a module that uses other modules that YOU have written.
2. You can have a module that has both function definitions and a script that can be executed.

---

**A Final Example**

We write a procedure to draw this

and a script that calls it twice:

We put them both in the SAME module....
A Final Example

```python
from simpleGraphics import *

def DrawTile(x, y, r, c1, c2, c3):
    DrawRect(x, y, 2*r, 2*r, FillColor=c1)
    DrawDisk(x, y, r, FillColor=c2)
    DrawStar(x, y, r, FillColor=c3)

if __name__ == '__main__':
    MakeWindow(6, bgcolor=BLACK, labels=False)
    DrawTile(3, 0, 2, MAGENTA, PURPLE, YELLOW)
    DrawTile(-3, 0, 2, MAGENTA, PURPLE, YELLOW)
    ShowWindow()
```

See the demo Tile.py In command mode, enter python Tile.py

A Final Example

```python
from SimpleGraphics import *

def DrawTile(x, y, r, c1, c2, c3):
    DrawRect(x, y, 2*r, 2*r, color=c1)
    DrawDisk(x, y, r, color=c2)
    DrawStar(x, y, r, color=c3)

if __name__ == '__main__':
    MakeWindow(6, bgcolor=BLACK, labels=False)
    DrawTile(3, 0, 2, MAGENTA, PURPLE, YELLOW)
    DrawTile(-3, 0, 2, MAGENTA, PURPLE, YELLOW)
    ShowWindow()
```

See the demo Tile.py In command mode, enter python Tile.py

So a Module Can Look Like This

```
Data
Function Definitions

if __name__ == '__main__':
    Gotta have
    Application Script
```

Those are "double underscores" in the if statement

Summary

1. Procedures "look like" functions without the "return." They "do stuff" but do not return values.
2. Graphics procedures were used to illustrate the idea.
3. Color can be encoded with three numbers that indicate the amount of red, green, and blue.
4. A single module can house data, functions, and a script at the same time.
