

8. Iteration: Strings

Topics:

Using Methods from the string class

Iterating through a string with `for`

Iterating Through a String

Two problems we cannot easily solve:

1. Given a string `s`, assign to `t` the "reversed" string. `'abcd' → 'dcba'`
2. Given a string `s`, how many digit characters does it contain? `'1or2or3' → 3`

The Reverse String Problem

```
s = 'abcd'
t = ''
for c in s:
    t = c + t
```

`s` -> `'abcd'`

`t` -> `'dcba'`

How does the `for` loop work?

The Number-of-Digits Problem

```
s = '2x78y'
n = 0
for c in s:
    if c.isdigit():
        n=n+1
```

`s` -> `'2x78y'`

`n` -> `3`

How does the `for` loop work?

Using `for` to Traverse a String Character-by-Character

```
s = 'abcd'
for c in s:
    print c
```

Output:

```
a
b
c
d
```

In this example, the "for-loop" variable is `c`. One at a time, it takes on the value of each character in `s`.

The Reverse String Problem

```
s = 'abcd'
t = ''
for c in s:
    t = c + t
print t
```

`s` -> `'abcd'`

`t` -> `''`

`t` -> `'abcd'`

`c` -> `'a'`

At the start of the loop, `c` is assigned the zeroth character in `s`.

The Reverse String Problem

```
s = 'abcd'
t = ''
for c in s:
    t = c + t
print t
```

s -> 'abcd'

t -> ''

•

'abcd'

c -> 'a'

The loop body is executed using that value in c.

The Reverse String Problem

```
s = 'abcd'
t = ''
for c in s:
    t = c + t
print t
```

s -> 'abcd'

t -> 'a'

•

'abcd'

c -> 'a'

The loop body is executed using that value in c.

The Reverse String Problem

```
s = 'abcd'
t = ''
for c in s:
    t = c + t
print t
```

s -> 'abcd'

t -> 'a'

•

'abcd'

c -> 'b'

The next time through the loop, c is assigned the first character in s.

The Reverse String Problem

```
s = 'abcd'
t = ''
for c in s:
    t = c + t
print t
```

s -> 'abcd'

t -> 'a'

•

'abcd'

c -> 'b'

The loop body is executed using that value in c.

The Reverse String Problem

```
s = 'abcd'
t = ''
for c in s:
    t = c + t
print t
```

s -> 'abcd'

t -> 'ba'

•

'abcd'

c -> 'b'

The loop body is executed using that value in c.

The Reverse String Problem

```
s = 'abcd'
t = ''
for c in s:
    t = c + t
print t
```

s -> 'abcd'

t -> 'ba'

•

'abcd'

c -> 'c'

The next time through the loop, c is assigned the second character in s.

The Reverse String Problem

```
s = 'abcd'
t = ''
for c in s:
    t = c + t
print t
```

s -> 'abcd'

t -> 'cba'

'abcd'

c -> 'c'

The loop body is executed using that value in c.

The Reverse String Problem

```
s = 'abcd'
t = ''
for c in s:
    t = c + t
print t
```

s -> 'abcd'

t -> 'ba'

'abcd'

c -> 'c'

The loop body is executed using that value in c.

The Reverse String Problem

```
s = 'abcd'
t = ''
for c in s:
    t = c + t
print t
```

s -> 'abcd'

t -> 'cba'

'abcd'

c -> 'd'

The last time through the loop, c is assigned the third character in s.

The Reverse String Problem

```
s = 'abcd'
t = ''
for c in s:
    t = c + t
print t
```

s -> 'abcd'

t -> 'cba'

'abcd'

c -> 'd'

The loop body is executed using that value in c.

The Reverse String Problem

```
s = 'abcd'
t = ''
for c in s:
    t = c + t
print t
```

s -> 'abcd'

t -> 'dcba'

'abcd'

c -> 'd'

The loop body is executed using that value in c.

The Reverse String Problem

```
s = 'abcd'
t = ''
for c in s:
    t = c + t
print t
```

s -> 'abcd'

t -> 'dcba'

Output: dcba

The string has been traversed. The iteration ends. The next statement after the loop is executed. Indentation important.

for-loop Mechanics

```
for <loop variable> in <string>:
```

Loop Body

If the string has length n , then the loop body is executed n times.

for-loop Mechanics

```
for x in y:
```

Loop Body

Let $x = y[0]$ and then execute the loop body.
 Let $x = y[1]$ and then execute the loop body.
 Let $x = y[2]$ and then execute the loop body.
 etc
 Let $x = y[n-1]$ and then execute the loop body.

Function for Reversing Strings

```
def Reverse(s):
    """ Returns a string that is obtained
    from s by reversing the order of its
    characters.

    Precondition: s is a string."""

    t = ''           # The empty string
    for c in s:
        t = c+t     # Repeated concatenation
    return t
```

The Number-of-Digits Problem

Given a string s , how many of its characters are digit characters?

'a10b20c30d40' → 8

The Number-of-Digits Problem

```
s = '2z78y'
n = 0
for x in s:
    if x.isdigit():
        n=n+1
print n
```

s -> '2z78y'
 n -> 0
 •
 '2z78y'
 x -> '2'

At the start of the loop, x is assigned the zeroth character in s .

The Number-of-Digits Problem

```
s = '2z78y'
n = 0
for x in s:
    if x.isdigit():
        n=n+1
print n
```

s -> '2z78y'
 n -> 0
 •
 '2z78y'
 x -> '2'

The loop body is executed using that value in x .

The Number-of-Digits Problem

```
s = '2z78y'
n = 0
for x in s:
    if x.isdigit():
        n=n+1
print n
```

s -> '2z78y'

n -> 1

•

'2z78y'

x -> '2'

The loop body is executed using that value in x.

The Number-of-Digits Problem

```
s = '2z78y'
n = 0
for x in s:
    if x.isdigit():
        n=n+1
print n
```

s -> '2z78y'

n -> 1

•

'2z78y'

x -> 'z'

The next time through the loop, x is assigned the first character in s.

The Number-of-Digits Problem

```
s = '2z78y'
n = 0
for x in s:
    if x.isdigit():
        n=n+1
print n
```

s -> '2z78y'

n -> 1

•

'2z78y'

x -> 'z'

The loop body is executed using that value in x.

The Number-of-Digits Problem

```
s = '2z78y'
n = 0
for x in s:
    if x.isdigit():
        n=n+1
print n
```

s -> '2z78y'

n -> 1

•

'2z78y'

x -> '7'

The next time through the loop, x is assigned the second character in s.

The Number-of-Digits Problem

```
s = '2z78y'
n = 0
for x in s:
    if x.isdigit():
        n=n+1
print n
```

s -> '2z78y'

n -> 1

•

'2z78y'

x -> '7'

The loop body is executed using that value in x.

The Number-of-Digits Problem

```
s = '2z78y'
n = 0
for x in s:
    if x.isdigit():
        n=n+1
print n
```

s -> '2z78y'

n -> 2

•

'2z78y'

x -> '7'

The loop body is executed using that value in x.

The Number-of-Digits Problem

```

s = '2z78y'
n = 0
for x in s:
    if x.isdigit():
        n=n+1
print n

```

s -> '2z78y'
n -> 2
'2z78y'
x -> '8'

The next time through the loop, `x` is assigned the third character in `s`.

The Number-of-Digits Problem

```

s = '2z78y'
n = 0
for x in s:
    if x.isdigit():
        n=n+1
print n

```

s -> '2z78y'
n -> 2
'2z78y'
x -> '8'

The loop body is executed using that value in `x`.

The Number-of-Digits Problem

```

s = '2z78y'
n = 0
for x in s:
    if x.isdigit():
        n=n+1
print n

```

s -> '2z78y'
n -> 3
'2z78y'
x -> '8'

The loop body is executed using that value in `x`.

The Number-of-Digits Problem

```

s = '2z78y'
n = 0
for x in s:
    if x.isdigit():
        n=n+1
print n

```

s -> '2z78y'
n -> 3
'2z78y'
x -> 'y'

The next time through the loop, `x` is assigned the fourth character in `s`.

The Number-of-Digits Problem

```

s = '2z78y'
n = 0
for x in s:
    if x.isdigit():
        n=n+1
print n

```

s -> '2z78y'
n -> 3
'2z78y'
x -> 'y'

The loop body is executed using that value in `x`.

The Number-of-Digits Problem

```

s = '2z78y'
n = 0
for x in s:
    if x.isdigit():
        n=n+1
print n

```

s -> '2z78y'
n -> 3
Output: 3

The string has been traversed. The iteration ends. The next statement after the loop is executed. Indentation important.

Function for Counting Digits

```
def nDigits(s):  
    """ Returns an int whose value is the  
    number of digit characters that are in  
    s.  
  
    Precondition: s is a string."""  
    n = 0;  
    for c in s:  
        # Increment n if c is a digit  
        if c.isdigit():  
            n=n+1  
    return n
```
