1 Multiples of k

The following program reads an integer k and outputs all the multiples of k up to 1000. Fill in the blank.

```
k = input('Please \ enter \ a \ positive \ integer \ smaller \ than \ 1000: \ '); for j = \_\_\_\_ fprintf('\%d ', j); end fprintf('\n');
```

2 Approximate square root (again!)

The square root of a positive value A can be computed by building "increasingly square" rectangles with area A. Write a script to solicit a positive value A and an a positive integer N. Then compute \sqrt{A} by building N increasingly square rectangles. Let the first rectangle have length A and width 1. The final square root value is the average of the length and width of the Nth rectangle.

Do not use arrays, i.e., you will use scalar variables L and W for the length and width of a rectangle, respectively.

3 Approximate π

[Modified from Insight Exercise P2.1.5] For large n,

$$T_n = 1 + \frac{1}{2^2} + \dots + \frac{1}{n^2} = \sum_{k=1}^n \frac{1}{k^2}$$
 $\approx \frac{\pi^2}{6}$

$$R_n = 1 - \frac{1}{3} + \dots + \frac{(-1)^{n+1}}{2n-1} = \sum_{k=1}^n \frac{(-1)^{k+1}}{2k-1} \approx \frac{\pi}{4}$$

giving two different ways to estimate π :

$$\tau_n = \sqrt{6T_n}$$

$$\rho_n = 4R_n$$

Write a script that displays the value of $|\pi - \rho_n|$ and $|\pi - \tau_n|$ for $n = 100, 200, \dots, 1000$ in one table. Do not use arrays.
