

- Previous class:
 - User-defined function
 - Nested loops
- Now:
 - Working with colors
 - 1-dimensional array—vector

Plot a continuous function (from a table of values)

x	sin(x)
0.00	0.0
1.57	1.0
3.14	0.0
4.71	-1.0
6.28	0.0

Plot based on 5 points

Generating tables and plots

x	sin(x)
0.000	0.000
0.784	0.707
1.571	1.000
2.357	0.707
3.142	0.000
3.927	-0.707
4.712	-1.000
5.498	-0.707
6.283	0.000

x, y are vectors. A vector is a 1-dimensional list of values

```
x= linspace(0,2*pi,9);
y= sin(x);
plot(x,y)
```

Note: x, y are shown in columns due to space limitation; they should be rows.

Built-in function `linspace`

```
x= linspace(1,3,5)
```

x	1.0	1.5	2.0	2.5	3.0
---	-----	-----	-----	-----	-----

```
x= linspace(0,1,101)
```

x	0.00	0.01	0.02	...	0.99	1.00
---	------	------	------	-----	------	------

Left endpoint Right endpoint Number of points

How did we get all the sine values?

x	sin(x)
0.00	0.0
1.57	1.0
3.14	0.0
4.71	-1.0
6.28	0.0

Built-in functions accept arrays

0.00	1.57	3.14	4.71	6.28
------	------	------	------	------

sin

and return arrays

0.00	1.00	0.00	-1.00	0.00
------	------	------	-------	------

Vectorized addition

x	2	1	.5	8
+	1	2	0	1
=	3	3	.5	9

Matlab code: `z = x + y`

Vectorized multiplication

	a	<table border="1" style="display: inline-table;"><tr><td>2</td><td>1</td><td>.5</td><td>8</td></tr></table>	2	1	.5	8
2	1	.5	8			
x	b	<table border="1" style="display: inline-table;"><tr><td>1</td><td>2</td><td>0</td><td>1</td></tr></table>	1	2	0	1
1	2	0	1			

=	c	<table border="1" style="display: inline-table;"><tr><td>2</td><td>2</td><td>0</td><td>8</td></tr></table>	2	2	0	8
2	2	0	8			

Matlab code: `c = a .* b`

↑

Vectorized
 element-by-element arithmetic operations
 on arrays

A dot (.) is necessary in front of these math operators

Shift

x	<table border="1" style="display: inline-table;"><tr><td>3</td></tr></table>	3				
3						
+	y	<table border="1" style="display: inline-table;"><tr><td>2</td><td>1</td><td>.5</td><td>8</td></tr></table>	2	1	.5	8
2	1	.5	8			

=	z	<table border="1" style="display: inline-table;"><tr><td>5</td><td>4</td><td>3.5</td><td>11</td></tr></table>	5	4	3.5	11
5	4	3.5	11			

Matlab code: `z = x + y`

Reciprocate

x	<table border="1" style="display: inline-table;"><tr><td>1</td></tr></table>	1				
1						
/	y	<table border="1" style="display: inline-table;"><tr><td>2</td><td>1</td><td>.5</td><td>8</td></tr></table>	2	1	.5	8
2	1	.5	8			

=	z	<table border="1" style="display: inline-table;"><tr><td>.5</td><td>1</td><td>2</td><td>.125</td></tr></table>	.5	1	2	.125
.5	1	2	.125			

Matlab code: `z = x ./ y`

↑

Vectorized
 element-by-element arithmetic operations between an
 array and a scalar

A dot (.) is necessary in front of these math operators

The dot in `.*`, `./`, `.^` not necessary but OK

Color is a 3-vector, sometimes called the RGB
 values

- Any color is a mix of red, green, and blue
- Example: `color = [0.4 0.6 0]`
- Each component is a real value in [0,1]
- [0 0 0] is black
- [1 1 1] is white
- [.2 .2 .2] is dark gray
- [.4 .6 .1] is a colored hue

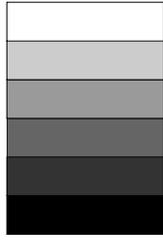

Mix two colors

Implement this function:

```
function newc = mixEqual(c1,c2)
% Average colors c1 and c2.
% c1, c2, and newc are vectors
% representing colors.
% Display the three colors.
```

15

Let's show the "paint chips" from white to black

Name the script `white2black`

16

1-d array: **vector**

- An array is a **named** collection of **like** data organized into rows or columns
- A 1-d array is a row or a column, called a **vector**
- An **index** identifies the **position** of a value in a vector

score	93	92	87	0	90	82
	1	2	3	4	5	6

17

Array index starts at 1

x	5	.4	.91	-4	-1	7
	1	2	3	4	5	6

Let k be the index of vector x , then

- k must be a positive integer
- $1 \leq k \leq \text{length}(x)$
- To access the k^{th} element: $x(k)$

18

Accessing values in a vector

score	93	99	87	80	85	82
	1	2	3	4	5	6

Given the vector `score` ...

```
score(4) = 80;
score(5) = (score(4)+score(5))/2;
k = 1;
score(k+1) = 99;
```

20

A few different ways to create a vector
 (More later!)

```
count = zeros(1,6)    count [0 0 0 0 0 0]
x = linspace(10,30,5) x [10 15 20 25 30]
y = [3 7 2 1]        y [3 7 2 1]
z = [3; 7; 2]        z [3; 7; 2]
```

21

Drawing a single line segment

```
a= 0; % x-coord of pt 1
b= 1; % y-coord of pt 1
c= 5; % x-coord of pt 2
d= 3; % y-coord of pt 2
plot([a c], [b d], '-*')
```

x-values
(a vector)

y-values
(a vector)

Line/marker
format

22

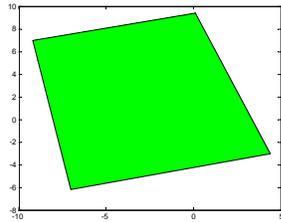

Drawing a polygon (multiple line segments)

```
% Draw a rectangle with the lower-left
% corner at (a,b), width w, height h.
x= [          ]; % x data
y= [          ]; % y data
plot(x, y)
```

Fill in the missing vector values!

23

```
x= [0.1 -9.2 -7 4.4];
y= [9.4 7 -6.2 -3];
fill(x,y,'g')
```

27

Example

- Write a program fragment that calculates the cumulative sums of a given vector v .
- The cumulative sums should be stored in a vector of the same length as v .

1, 3, 5, 0 v

1, 4, 9, 9 cumulative sums of v

28

v

--	--	--	--	--	--

csum

--	--	--	--	--	--

29

A twinkling constellation

- Write a script that generates 9 random positions—the configuration of my constellation
- Simulate 10 rounds of twinkling
 - In each round, each star is **equally likely** to be lit or black
- Can you add some **random adjustment to the color** of the star?

31
