### Lecture 15

Hypothesis Testing

### **Announcements**

**Jury Panels** 

# **Jury Panels**

Section 197 of California's Code of Civil Procedure says, "All persons selected for jury service shall be selected at random, from a source or sources inclusive of a representative cross section of the population of the area served by the court." (Demo)

### **Statistics**

#### A statistic is a number calculated from a sample

## **Total Variation Distance**

Every distance has a computational recipe

Jemo

#### **Total Variation Distance** (TVD):

- For each category, compute the difference in proportions between two distributions
- Take the absolute value of each difference
- Sum & divide by 2

### **Empirical Distributions**

## **Distribution of a Statistic**

Statistic: A quantity computed for a particular sample

Distribution: The chance of each outcome of sampling

**Sampling distribution**: Chance of each value of a statistic (computed from all possible samples)

Also known as the probability distribution of the statistic

**Empirical distribution**: Observations of a statistic (computed from some samples drawn at random)

# **Simulating a Statistic**

Fix a sample size and choose your statistic.

- Simulate the statistic once:
  - Draw a random sample of the size you fixed.
  - Calculate the statistic and keep a record of the value
- Repeat previous step numerous times (as many times as you have patience for; thousands are good).

Jemo)

• You now have one value of the statistic for each repetition. Visualize the results.

#### The sample vs the distribution

To assess if sample was drawn randomly from distribution:

- Decide on a statistic that measures the distance between two distributions
- Compute the statistic from the sample; that is, the distance between distributions of sample and known population
- Sample at random and from the population and compute the statistic from the random sample; repeat numerous times
- Compare

# **Hypothesis Testing**

# **Testing a Hypothesis**

#### **Step 1: The Hypotheses**

- A test chooses between two views of how data were generated
- *Null hypothesis* proposes that data were generated at random
- *Alternative hypothesis* proposes some effect other than chance

#### Step 2: The Test Statistic

• A value that can be computed for the data and for samples

#### **Step 3: The Sampling Distribution of the Test Statistic**

- What the test statistic might be if the null hypothesis were true
- Approximate the sampling distribution by an empirical distribution

# **Conclusion of a Test**

Resolve choice between null and alternative hypotheses

- Compare observed test statistic to its empirical distribution under the null hypothesis
- If the observed value is **consistent** with the distribution, then the test *does not* support the alternative hypothesis

Whether a value is consistent with a distribution:

- A visualization may be sufficient
- Convention: The observed significance level (P-value)

(Demo)

# **Observed Significance Level**

**P-Value**: The chance, under the null hypothesis, that the test statistic is equal to the value that was observed or is even further in the direction of the alternative.

**Statistically Significant:** The P-value is less than 5%

Highly Statistically Significant: The P-value is less than 1%
