

**DSFA**  
Spring 2020

# Lecture 4

---

Data Types, Arithmetic, Tables and Arrays

# Announcements

---

- URL for website: [cornell-dsfa.org](http://cornell-dsfa.org).
  - What if you just added?
  - HW 01 due Friday 5:59 (bonus point for early submission by 11:59 tonight)
  - HW 02 posted tomorrow
  - Reminder: Get iClicker/Reef polling
  - Reminder: Pay for Vocareum (free 'until Feb 5')
-

# Announcements

---

- You can try to run the demos in class at [tinyurl.com/dsfa2020-demos](https://tinyurl.com/dsfa2020-demos); see Piazza post for details.

# Arithmetic

# Arithmetic Operators

---

Operation	Operator	Example	Value
Addition	+	$2 + 3$	5
Subtraction	-	$2 - 3$	-1
Multiplication	*	$2 * 3$	6
Division	/	$7 / 3$	2.66667
Remainder	%	$7 \% 3$	1
Exponentiation	**	$2 ** 0.5$	1.41421

---

(Demo)

# Ints and Floats

---

Python has two numeric types

- `int`: an integer of any size
- `float`: a number with an optional fractional part

An `int` never has a decimal point; a `float` always does

A `float` might be printed using scientific notation

Three limitations of float values:

- They have limited size (but the limit is huge)
  - They have limited precision of 15-16 decimal places
  - After arithmetic, the final few decimal places can be wrong
-

# Strings

# Text and Strings

---

A string value is a sequence of characters.

- `'a'`
- `'word'`
- `"There can be 2 sentences. Here's the second!"`

Strings that contain numbers can be converted to numbers

- `int('12')`
- `float('1.2')`

Any value can be converted to a string

- `str(5)`

(Demo)

---

# Discussion Question

---

Assume you have run the following statements

```
x = 3
```

```
y = '4'
```

```
z = '5.6'
```

What's the source of the error in each example?

A. `x + y`

B. `x + int(y + z)`

C. `str(x) + int(y)`

D. `str(x, y) + z`

---

# Arrays and Ranges

# Arrays

---

An array contains a sequence of values

- All elements of an array should have the same type
- Arithmetic is applied to each element individually
- When two arrays are added, they must have the same size; corresponding elements are added in the result
- A column of a table is an array

(Demo)

---

# Ranges

---

A range is an array of consecutive numbers

- `np.arange(end)`:  
An array of increasing integers from 0 up to `end`
- `np.arange(start, end)`:  
An array of increasing integers from `start` up to `end`
- `np.arange(start, end, step)`:  
A range with `step` between consecutive values

The range always includes `start` but excludes `end`

---

# Ways to create a table

---

- `Table.read_table(filename)` - reads a table from a spreadsheet
- `Table()` - an empty table
- and...

# Arrays → Tables

---

- `Table().with_column(label, data)` - creates a table with a single column; `data` is an array
  - `Table().with_columns(label1, data1, ...)` - creates a table, with an array of data for each column
-

# Table Methods

---

- Creating and extending tables:
    - `Table().with_columns` and `Table.read_table`
  - Finding the size: `num_rows` and `num_columns`
  - Referring to columns: labels, relabeling, and indices
    - `labels` and `reabeled`; column indices start at 0
  - Accessing data in a column
    - `column` takes a label or index and returns an array
  - Using array methods to work with data in columns
    - `item`, `sum`, `min`, `max`, and so on
  - Creating new tables containing some of the original columns:
    - `select`, `drop`
-

# Minard's Map

# Charles Joseph Minard, 1781-1870

---

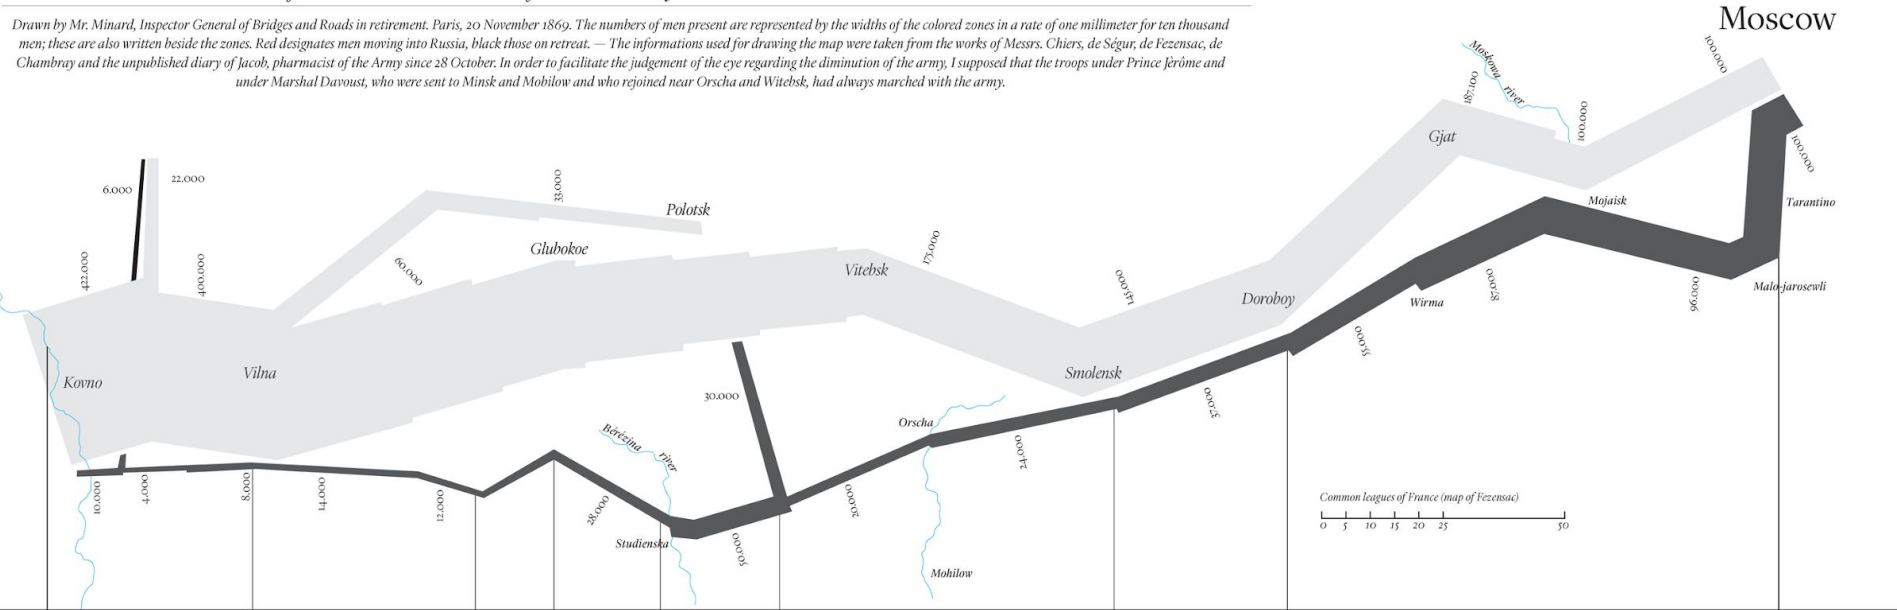

- French civil engineer who created one of the greatest graphs of all time
- Visualized Napoleon's 1812 invasion of Russia, including
  - the number of soldiers
  - the direction of the march
  - the latitude and longitude of each city
  - the temperature on the return journey
  - Dates in November and December

# Visualization of 1812 March

## FIGURATIVE MAP of the successive losses in men of the French Army in the RUSSIAN CAMPAIGN OF 1812-1813

Drawn by Mr. Minard, Inspector General of Bridges and Roads in retirement, Paris, 20 November 1869. The numbers of men present are represented by the widths of the colored zones in a rate of one millimeter for ten thousand men; these are also written beside the zones. Red designates men moving into Russia, black those on retreat. — The informations used for drawing the map were taken from the works of Messrs. Chiers, de Ségur, de Fezensac, de Chambray and the unpublished diary of Jacob, pharmacist of the Army since 28 October. In order to facilitate the judgement of the eye regarding the diminution of the army, I supposed that the troops under Prince Jérôme and under Marshal Davoust, who were sent to Minsk and Mohilow and who rejoined near Orscha and Witebsk, had always marched with the army.

## GRAPHIC TABLE of the temperature in degrees of Réaumur thermometer

# Different types of data

---

Longitude	Latitude	City	Direction	Survivors
32	54.8	Smolensk	Advance	145000
33.2	54.9	Dorogobouge	Advance	140000
34.4	55.5	Chjat	Advance	127100
37.6	55.8	Moscou	Advance	100000
34.3	55.2	Wixma	Retreat	55000
32	54.6	Smolensk	Retreat	24000
30.4	54.4	Orscha	Retreat	20000
26.8	54.3	Moiodexno	Retreat	12000

**float:**  
decimal number

**string:**  
text

**int:**  
integer

---

**Rows**

# Take Rows, Select Columns

---

The `select` method returns a table with only some columns

The `take` method returns a table with only some rows

- Rows are numbered, starting at 0
- Taking a single number returns a one-row table
- Taking a list of numbers returns a table as well

(Demo)

---

# The where method

---

- `t.where(label, condition)` - constructs a new table with just the rows that match the condition

(Demo)

---

# Manipulating Rows

---

- `t.sort(column)` sorts the rows in increasing order
  - `t.take(row_numbers)` keeps the numbered rows
    - Each `row` has an index, starting at 0
  - `t.where(column, are.condition)` keeps all rows for which a column's value satisfies a condition
  - `t.where(column, value)` keeps all rows containing a certain value in a column
-
