

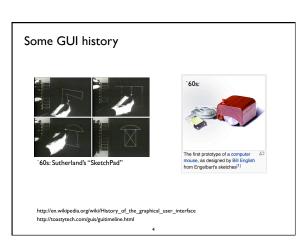

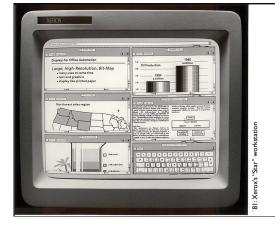

Graphical User Interface: a type of user interface that allows users to interact with programs through manipulation of graphical elements as opposed to text-based interfaces.

Mouse tales...

Their mouse had a mean time between failure of ... a week ... it would jam up irreparably, or ... jam up on the table-- ... It had a flimsy cord whose wires would break. Steve Jobs: "... Xerox says it can't be built for < \$400, I want a \$10 mouse that will never fail and can be mass produced, because it's going to be the primary interface of the computer ..."

... Dean Hovey ... came back, "I've got some good and some bad news. Good news: we've got a new project with Apple. Bad news: I told Steve we'd design a mouse for 10 bucks."

 \dots year later \dots we \dots filed \dots and were granted a patent, on the electro-mechanical-optical mouse of today; \dots we ended up \dots [making] the mouse as invisible to people as it is today.

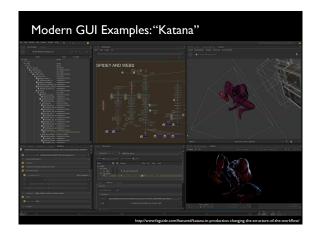

Steve Sachs interview on first computer with GUI: Apple Lisa (~\$10K in 1982). http://library.stanford.edu/mac/primary/interviews/sachs/trans.html

I

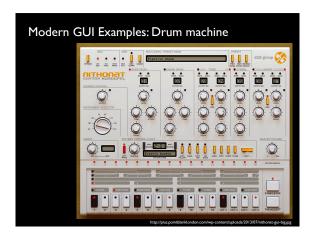

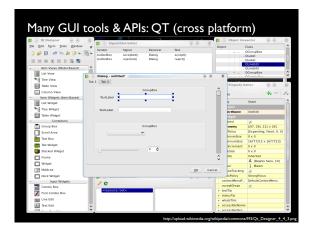

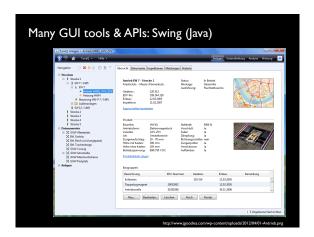

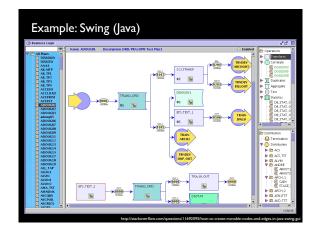

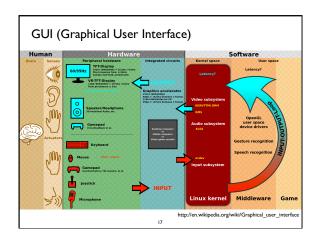

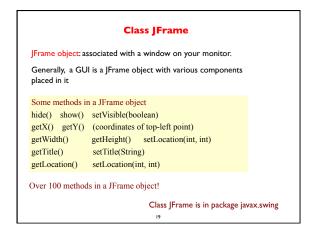

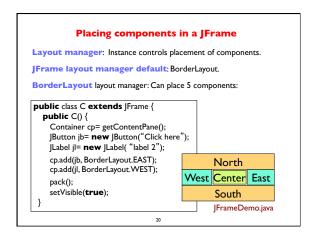

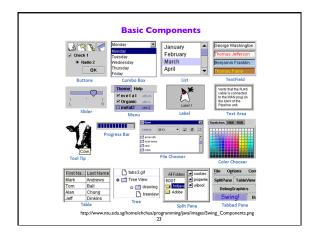

GUI (Graphical User Interface) Provides a friendly interface between user and program Allows event-driven or reactive programming: The program reacts to events such as button clicks, mouse movement, keyboard input Often is multi-threaded: Different threads of execution can be going on simultaneously We use Java's two packages for doing GUIs: AWT (Abstract Window Toolkit) —first one; very simple Swing —a newer one, which builds on AWT as much as possible Two aspects to making a GUI: Laying out components (buttons, text, etc.) in it. TODAY Listening/responding to events

```
Putting components in a JFrame
import java.awt.*; import javax.swing.*;
/** Demonstrate placement of components in a JFrame.
   Places five components in 5 possible areas:
    (1) a JButton in the east,
                                        (2) a JLabel in the west,
     (3) a JLabel in the south,
                                        (4) a JTextField in the north
    (5) a JTextArea in the center. */
public class ComponentExample extends JFrame {
   /** Constructor: a window with title t and 5 components */
   public ComponentExample(String t) {
                                                         Add components to
     super(t);
                                                               its contentPane
     Container cp= getContentPane(); its cp.add(new JButton("click me"), BorderLayout.EAST);
     cp.add(new JTextField("type here", 22), BorderLayout.NORTH);
     cp.add(new JCheckBox("I got up today"), BorderLayout.SOUTH); cp.add(new JLabel("label 2"), BorderLayout.WEST);
     cp.add(new JTextArea("type\nhere", 4, 10), BorderLayout.CENTER);
     pack():
                                                     ComponentExample.iava
                                          21
```

Packages -- Components Packages that contain classes that deal with GUIs: java.awt: Old package. javax.swing: New package. javax.swing has a better way of listening to buttons. xxxx in awt text fields, etc. Components are more flexible. Jxxxx in Swing Component: Something that can be placed in a GUI window. They are instances of certain classes, e.g. JButton, Button: JLabel, Label Clickable button Line of text JTextField, TextField: Field into which the user can type JTextArea, TextArea: Many-row field into which user can type
JPanel, Panel: Used for graphics; to contain other components JCheckBox Checkable box with a title Menu of items, one of which can be checked JComboBox: JRadioButton: Same functionality as JCheckBox Container: Can contain other components Can contain other components 22

Basic Components Component: Something that can be Component placed in a GUI window. These are Button, Canvas Checkbox, Choice Label, List, Scrollbar the basic ones used in GUIs TextComponent TextField, TextArea Container Note the use of subclasses JComponent AbstractButton to provide structure and JButton efficiency. For example. JToggleButton there are two kinds of JCheckBox JToggleButtons, so that RadioButton class has two subclasses. JLabel, JList JOptionPane, JPanel JPopupMenu, JScrollBar, JSlider JTextComponent JTextField JTextArea

```
Components that can contain other components
Component
                        java.awt is the old GUI package.
  Container
      JComponent
                        javax.swing is the new GUI package.
      IPanel
                         When they wanted to use an old name,
      Panel
                         they put J in front of it.
        Applet
  Window
                        (e.g. Frame and JFrame)
      Frame
        JFrame
      .JWindow
                        When constructing javax.swing, the
                        attempt was made to rely on the old
                        package as much as possible.
                        So, JFrame is a subclass of Frame.
                        But they couldn't do this with JPanel.
```

```
import java.awt.*; import javax.swing.*;
/** Instance has labels in east /west, JPanel with four buttons in center. */
public class PanelDemo extends JFrame {
   JPanel p= new JPanel();
   /** Constructor: a frame with title "Panel demo", labels in east/west, blank label in south, JPanel of 4 buttons in the center */
   public PanelDemo() {
      super("Panel demo");
                                                                JPanel as a
      p.add(new JButton("0")); p.add(new JButton("1"));
                                                                 container
      p.add(new JButton("2")); p.add(new JButton("3"));
      Container cp= getContentPane();
      cp.add(new JLabel("east"), BorderLayout.EAST);
      cp.add(new JLabel("west"), BorderLayout.WEST); cp.add(new JLabel(" "), BorderLayout.SOUTH);
      cp.add(p, BorderLayout.CENTER);
      pack();
                                JPanel layout manager default: FlowLayout.
                 FlowLayout layout manager: Place any number of components.
}
               They appear in the order added, taking as many rows as necessary.
```

```
import javax.swing.*; import java.awt.*;
/** Demo class Box. Comment on constructor says how frame is laid out. */
public class BoxDemo extends JFrame {
   /** Constructor: frame with title "Box demo", labels in the east/west,
      blank label in south, horizontal Box with 4 buttons in center. */
   public BoxDemo() {
                                                            Class Box: a
     super("Box demo");
                                                               container
      Box b= new Box(BoxLayout.X_AXIS);
     b.add(new JButton("0")); b.add(new JButton("1")); b.add(new JButton("2")); b.add(new JButton("3"));
     Container cp= getContentPane();
     cp.add(new JLabel("east"), BorderLayout.EAST);
     cp.add(new JLabel("west"), BorderLayout.WEST); cp.add(new JLabel(" "), BorderLayout.SOUTH
                                 BorderLayout.SOUTH):
     cp.add(b,
                                  BorderLayout.CENTER);
     pack():
                                 Box layout manager default: BoxLayout.
}
                BoxLayout layout manager: Place any number of components.
                           They appear in the order added, taking only one row.
```

```
public class BoxDemo2 extends JFrame {
   * Constructor: frame with title t and 3 columns with n, n+1, and n+2 buttons. */
public BoxDemo2(String t, int n) {
    super(t);
    // Create Box b1 with n buttons.
                                                   Boxes within a Box
         Box b I = new Box(BoxLayout.Y_AXIS);
                                                     3 vertical boxes, each
        for (int i= 0; i!= n; i= i+1)
bl.add(new JButton("I " + i));
                                                      a column of buttons.
    // Create Box b2 with n+1 buttons.
                                                               are placed in a
        Box b2= ..
                                                               horizontal box
    // Create Box b3 with n+2 buttons
         Box b3= ...
    // Create horizontal box b containing b1, b2, b3
                                                              BoxLayout layout
        Box b= new Box(BoxLayout.X AXIS);
                                                               manager: Place any
         b.add(b1);
                                                          number of components.
         b.add(b2):
                                                          They appear in the order added, taking only
         b.add(b3);
    Container cp= getContentPane(); cp.add(b, BorderLayout.CENTER);
                                                                          one row.
    pack(); show();
```

Simulate BoxLayout Manager in a JFrame

To simulate using a BoxLayout manager for a JFrame, create a Box and place it as the sole component of the JFrame:

JFrame jf= new JFrame("title");
Box b= new Box(BoxLayout.X_AXIS);
Add components to b;
jf.add(b,BorderLayout.CENTER);

- 1. Start developing a GUI by changing an already existing one. A lot of details. Hard to get all details right when one starts from scratch and has little idea about the Java GUI package.
- 2. Showed how to place components in a GUI. Next class: how to "listen" to things like button clicks in a GUI.
