

# CS/ENGRD 2110

## SPRING 2017

Lecture 6: Consequence of type, casting; function equals  
<http://courses.cs.cornell.edu/cs2110>

# Announcements

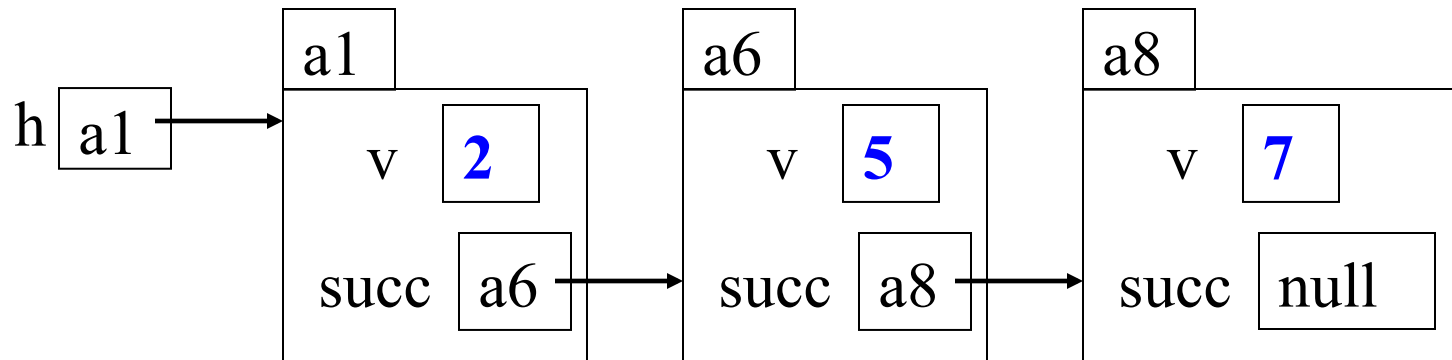

2

- **A3 will available on Piazza tomorrow.** Refer often to the Piazza FAQ Note for A3
- **Please read the assignment A1 FAQ Notes on the Piazza before asking a question.** It might already be answered.

# Assignment A3: Doubly linked Lists

3

Idea: maintain a list (2, 5, 7) like this:

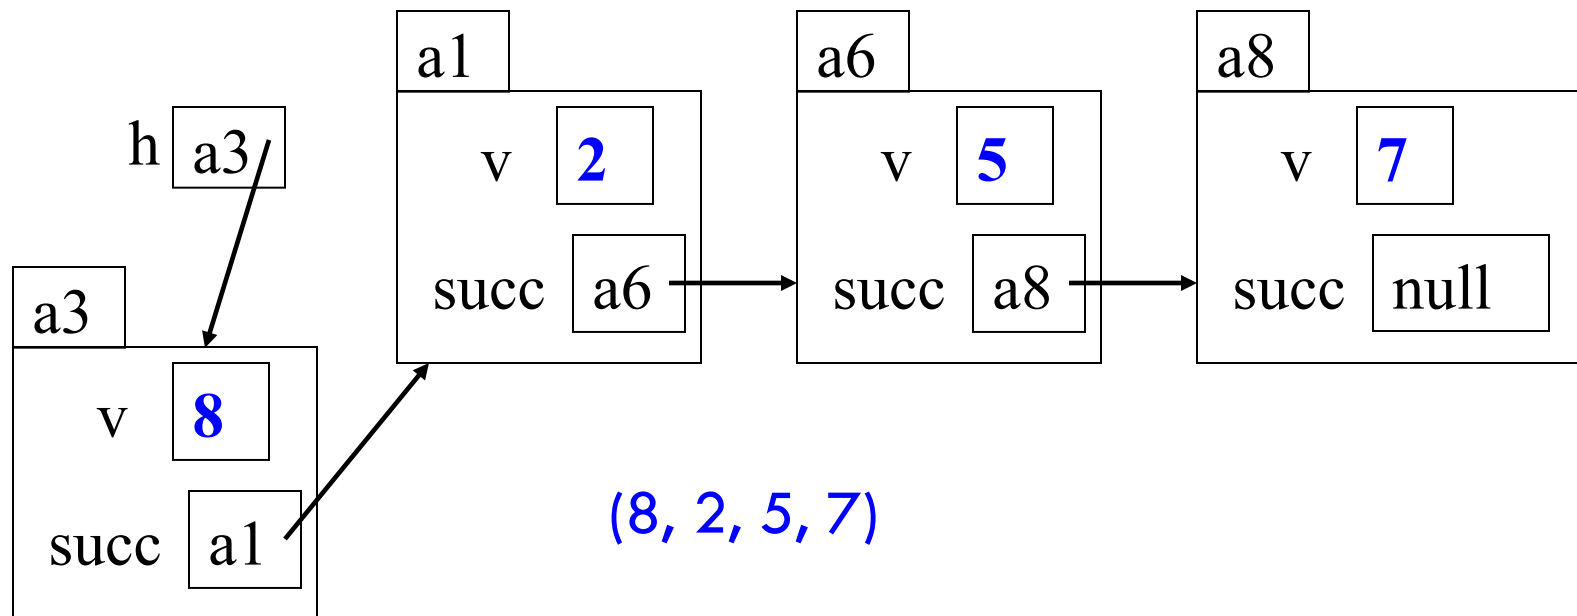

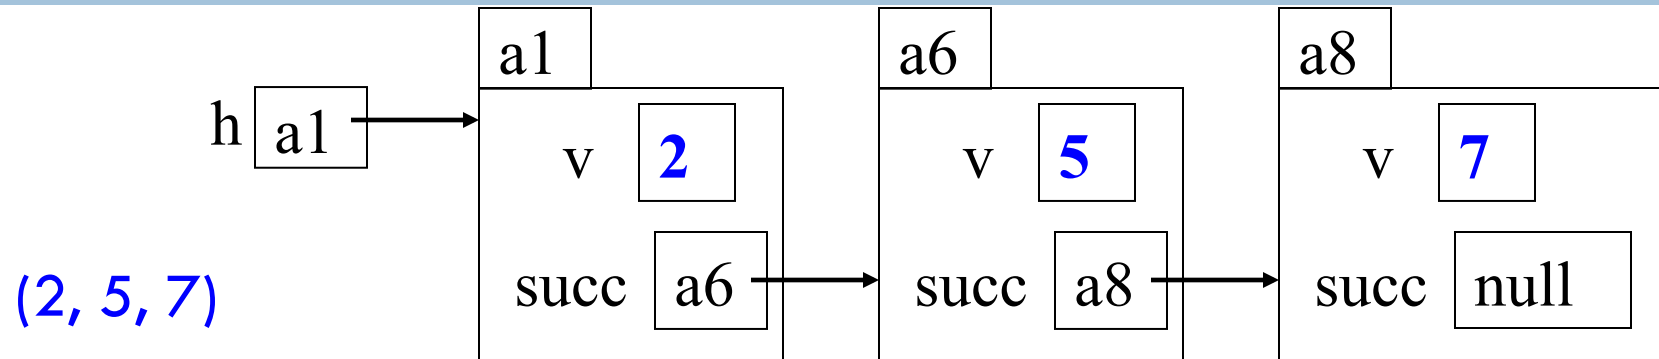

This is a singly linked list

To save space we write names like a6 instead of N@35abcd00

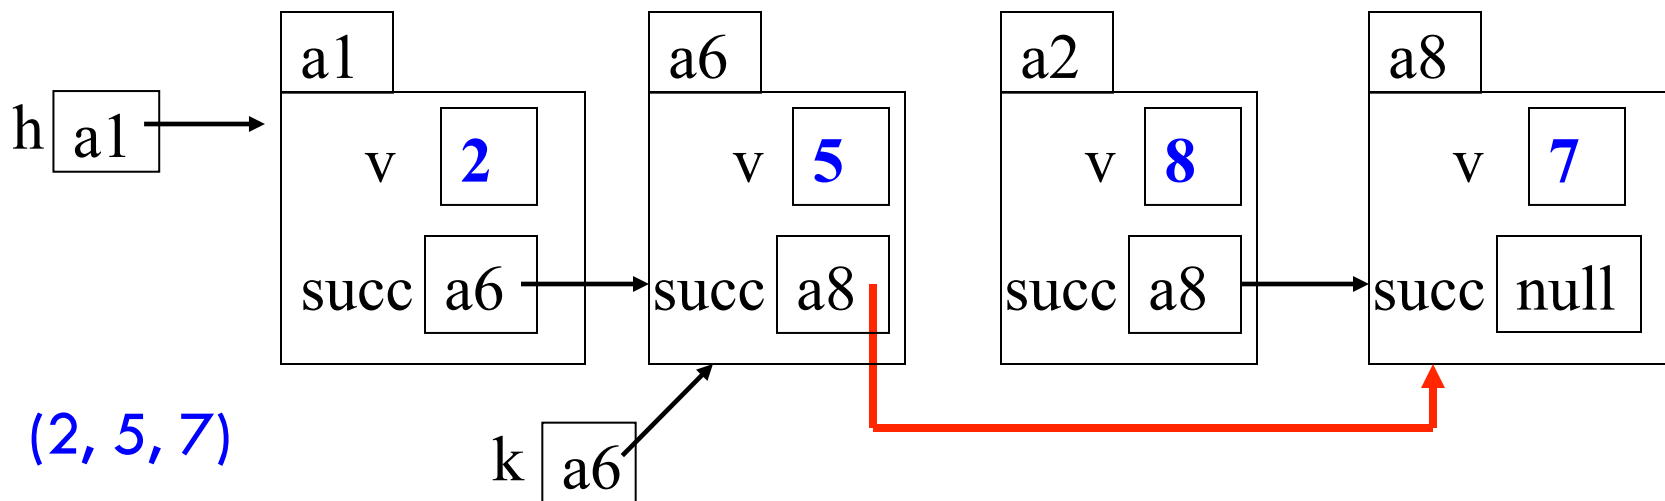

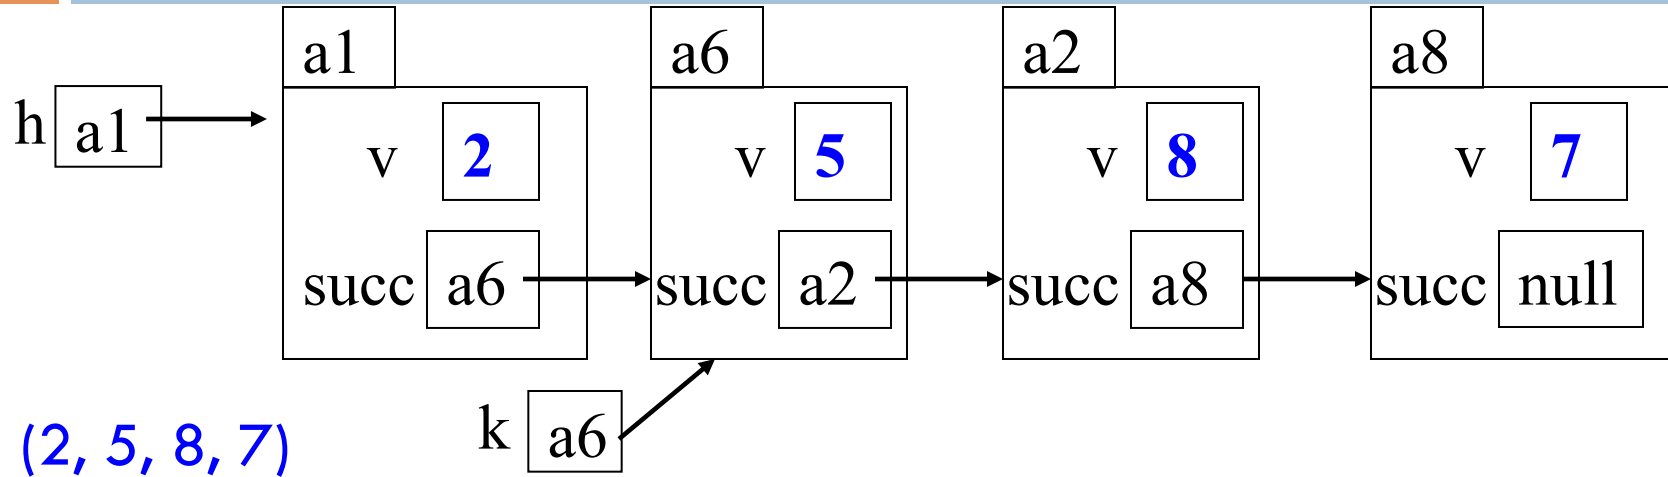

# How to insert a node at the beginning

4

# How to remove successor of a node in the middle

5

# Assignment A3: Use an **inner class**

6

```
public class C {  
    private int x;  
    public void m(int y) { ... ob= new Cin(...);  ob.b= 5;  }  
  
    private class Cin {  
        private int b;  
  
        public void mm() { ... x= b; ...  }  
    }  
}
```

In addition: methods of C can reference private components of Cin

Inside-out rule: Objects of Cin can reference components of the object of C in which they live.

# Assignment A3: Generics

7

```
public class LinkedList {  
    void add(Object elem) {...}  
    Object get(int index) {...}  
}
```

Values of linked list are probably of class Object

```
public class LinkedList<E> {  
    void add(E elem) {...}  
    E get(int index) {...}  
}
```

You can specify what type of values

```
ns = new LinkedList<Integer>();  
ns.add("Hello"); // error  
ns.add(5);  
String s = ns.get(0); // error  
int n = ns.get(0);
```

```
ss = new LinkedList<String>();  
ss.add("Hello");  
ss.add(5); // error  
String s = ss.get(0);  
int n = ss.get(0); // error
```

# Overview ref in text and JavaSummary.pptx

8

- Quick look at arrays **slide 50-55**
- Casting among classes **C.33-C.36 (not good)** **slide 34-41**
- Consequences of the class type **slide 34-41**
- Operator **instanceof** **slide 40**
- Function **equals** **slide 37-41**

**Homework.** Learn about while/ for loops in Java. Look in text.

```
while ( <bool expr> ) { ... } // syntax
```

```
for (int k= 0; k < 200; k= k+1) { ... } // example
```

# Classes we work with today

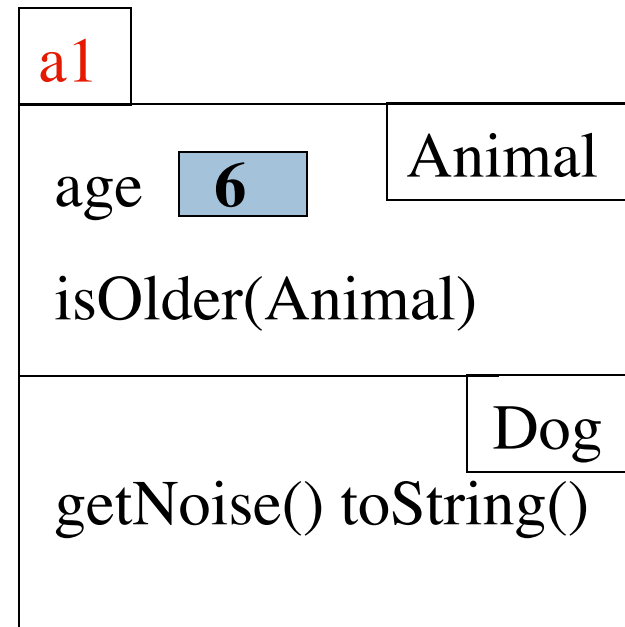

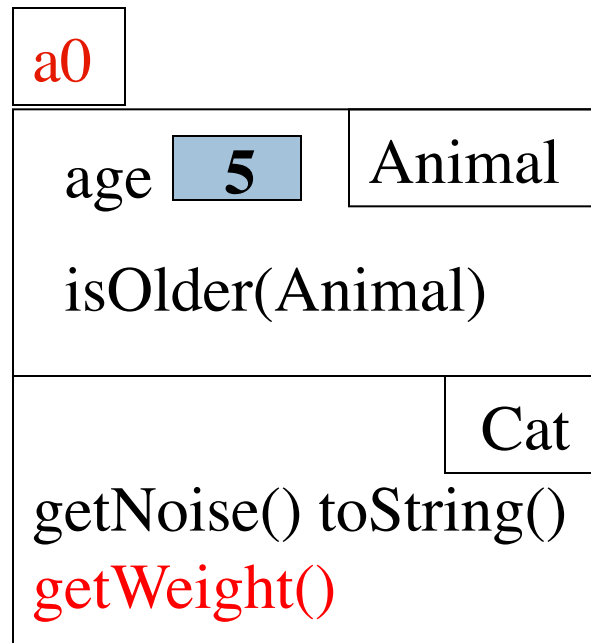

class hierarchy:

9

Work with a class **Animal** and subclasses like **Cat** and **Dog**

Put components common to animals in **Animal**

**Object** partition is there but not shown

# Animal[] v = new Animal[3];

10

declaration of array v

Create array of 3 elements

Assign value of new-exp to v

Assign and refer to elements as usual:

```
v[0] = new Animal(...);
```

...

```
a = v[0].getAge();
```

Sometimes use horizontal picture of an array:

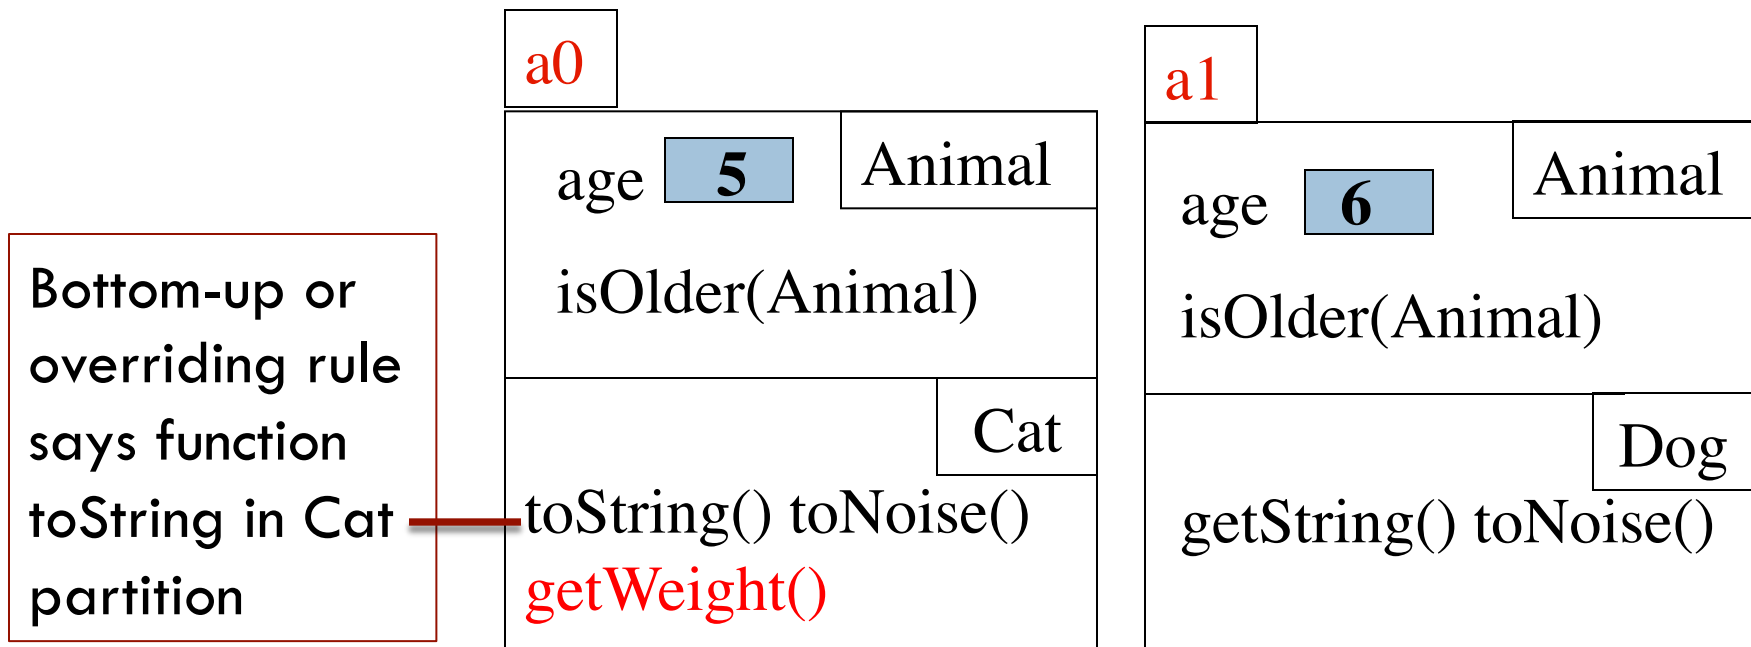

# Which function is called?

11

Which function is called by  
`v[0].toString()` ?

Remember, partition Object  
contains `toString()`

	0	1	2
v	a0	null	a1

# Consequences of a class type

12

`Animal[] v;`

declaration of `v`. Also means that each variable `v[k]` is of type `Animal`

The type of `v` is `Animal[]`

The type of each `v[k]` is `Animal`

The type is part of the syntax/grammar of the language. Known at compile time.

As we see on next slide, the type of a class variable like `v[k]` determines what methods can be called

## From an Animal variable, can use only methods available in class Animal

13

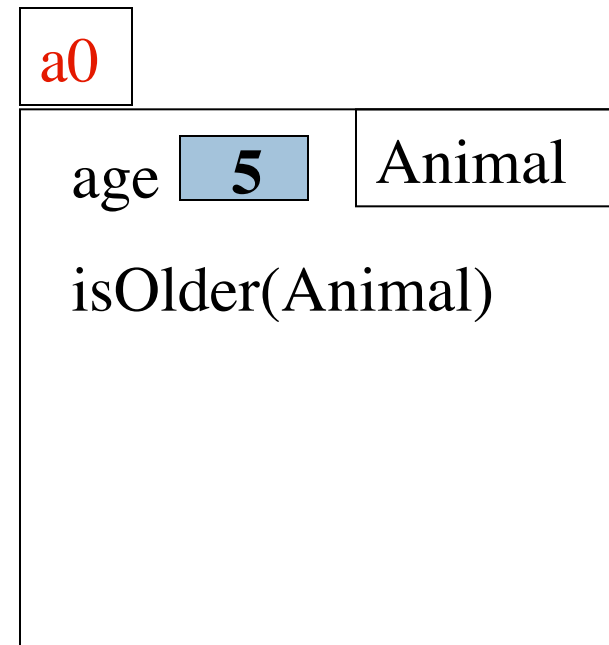

`a.getWeight()` is obviously illegal.  
The class won't compile.

When checking legality of a call like

`a.getWeight(...)`

since the type of `a` is `Animal`, function `getWeight` must be declared in `Animal` or one of its superclasses.

## From an Animal variable, can use only methods available in class Animal

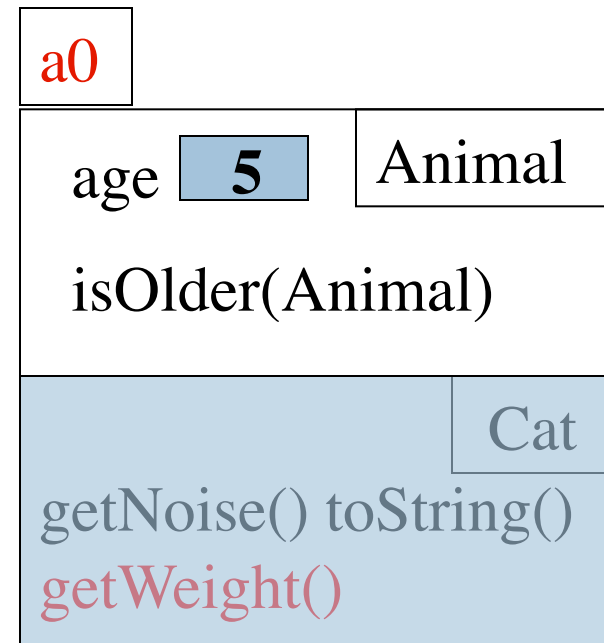

14

Suppose `a0` contains an object of a subclass `Cat` of `Animal`. By the rule below, `a.getWeight(...)` is still illegal. Remember, the test for legality is done at compile time, not while the program is running. ...

When checking legality of a call like `a.getWeight(...)`

since the type of `a` is `Animal`, function `getWeight` must be declared in `Animal` or one of its superclasses.

a a0 `Animal`

# From an Animal variable, can use only methods available in class Animal

15

The same object a0, from the viewpoint of a Cat variable and an Animal variable

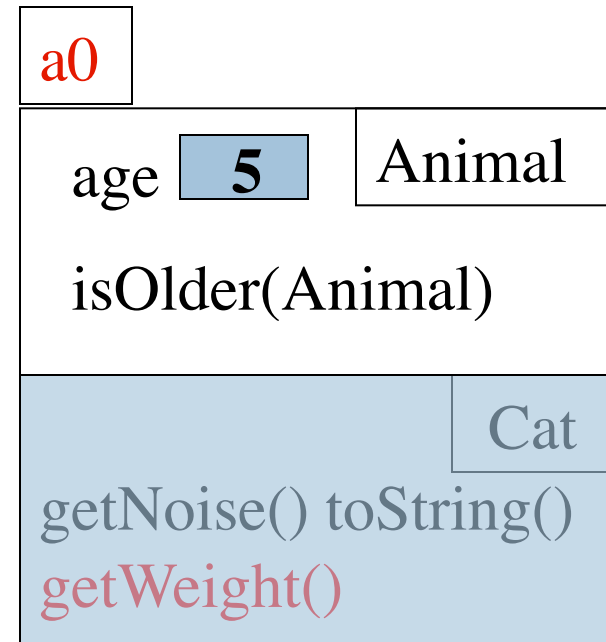

c.getWeight() is legal

a.getWeight() is illegal

because  
getWeight  
is not  
available  
in class  
Animal

## Rule for determining legality of method call

16

c a0  
C

Rule:  $c.m(\dots)$  is legal and the program will compile ONLY if method  $m$  is declared in  $C$  or one of its superclasses

$m(\dots)$  must be declared in one of these classes

# Another example

17

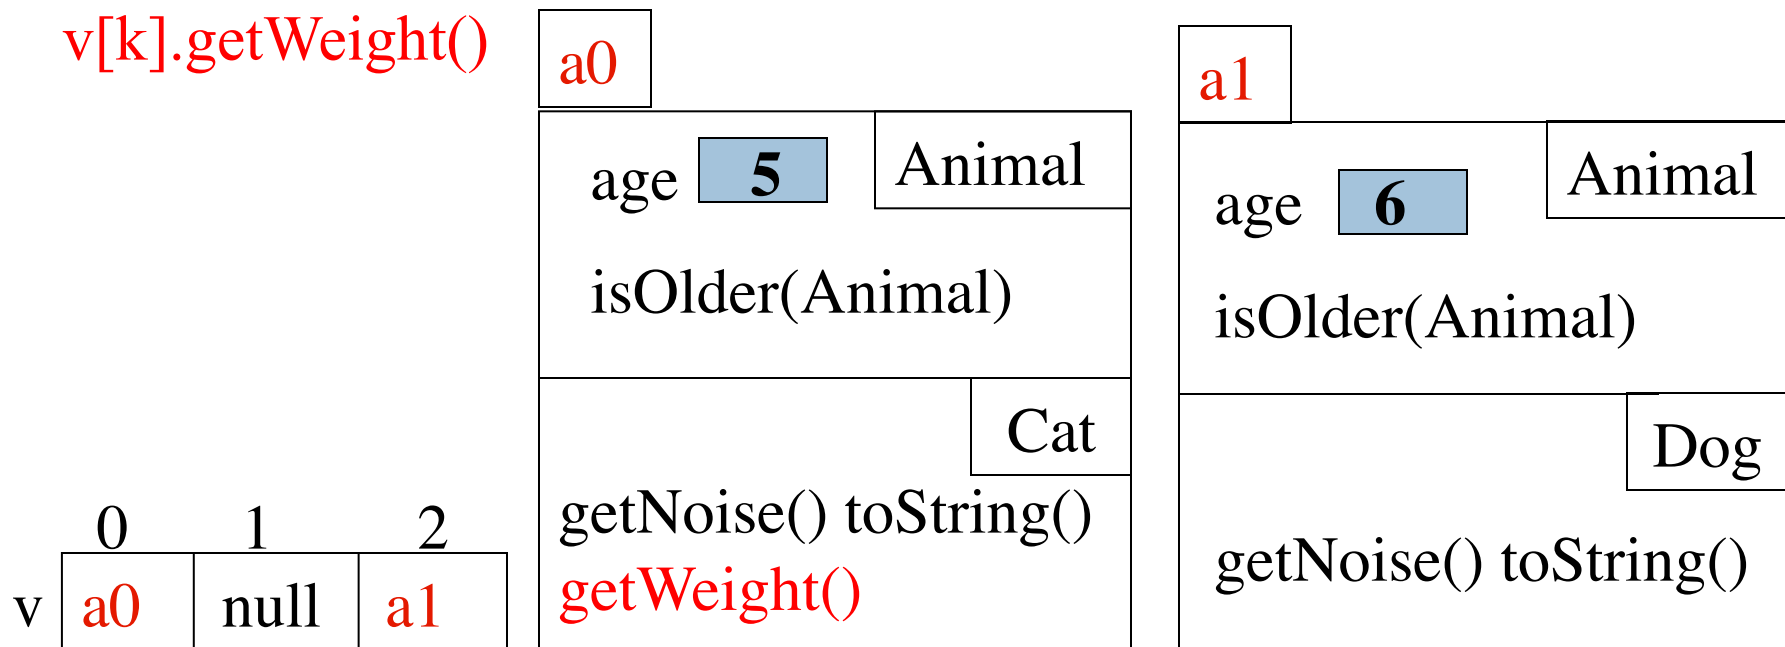

Type of v[0]: Animal

Should this call be allowed?  
Should program compile?

Should this call be allowed?  
Should program compile?

v[0].getWeight()

v[k].getWeight()

# View of object based on the type

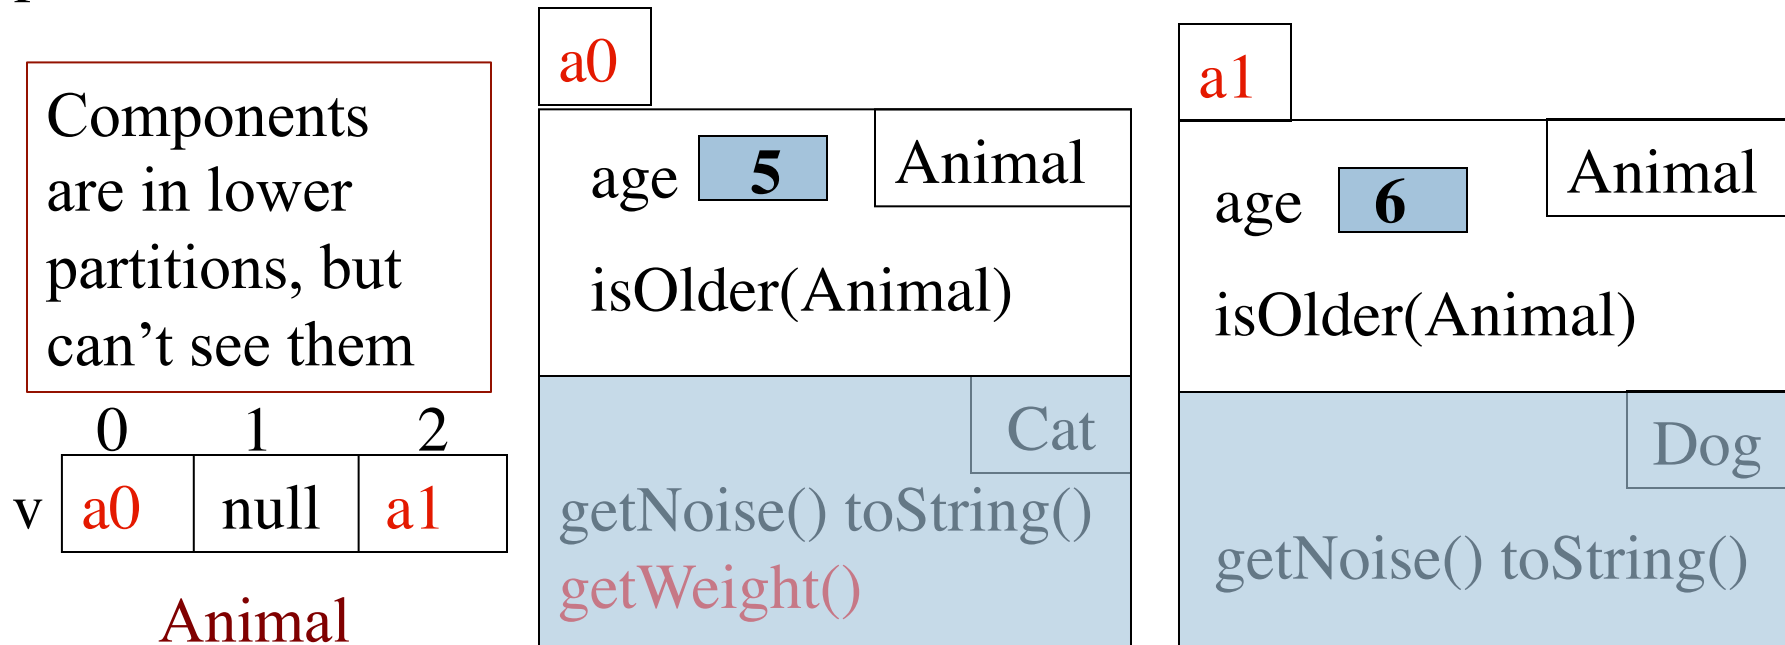

18

Each element  $v[k]$  is of type *Animal*.

From  $v[k]$ , see only what is in partition *Animal* and partitions above it.

`getWeight()` not in class *Animal* or *Object*. Calls are illegal, program does not compile:

`v[0].getWeight()` `v[k].getWeight()`

# Casting objects

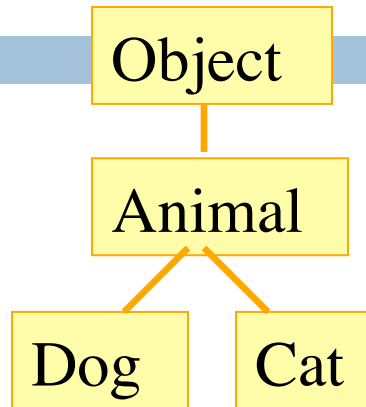

19

You know about casts like

**(int)** (5.0 / 7.5)

**(double)** 6

**double** d= 5; // automatic cast

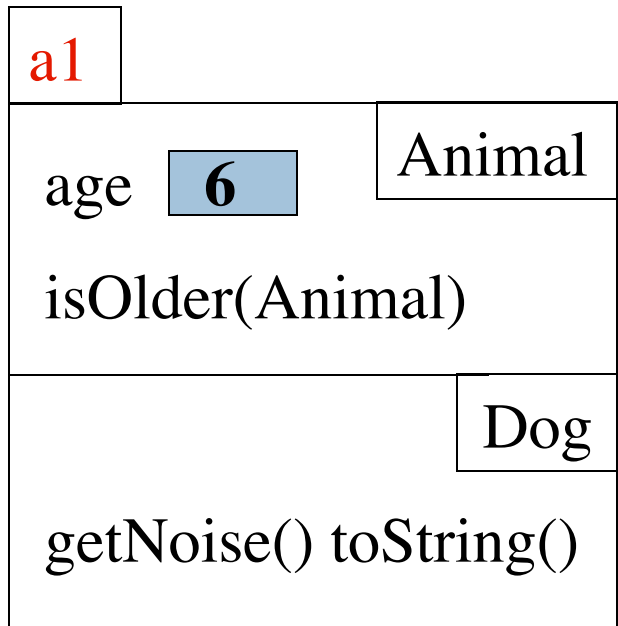

Discuss casts up/down class hierarchy.

**Animal** h= **new** Cat("N", 5);

**Cat** c= (Cat) h;

A class cast doesn't change the object. It just changes the perspective –how it is viewed!

# Explicit casts: unary prefix operators

20

**Rule:** an object can be cast to the name of any partition that occurs within it — and to nothing else.

`a0` can be cast to `Object`, `Animal`, `Cat`.

An attempt to cast it to anything else causes an exception

`(Cat) c`

`(Object) c`

`(Animal) (Animal) (Cat) (Object) c`

<code>a0</code>	
<code>equals() ...</code>	<code>Object</code>
<code>age</code> <code>5</code>	<code>Animal</code>
<code>isOlder(Animal)</code>	
<code>getNoise() toString()</code> <code>getWeight()</code>	<code>Cat</code>

These casts don't take any time. The object does not change. It's a change of perception

`c` `a0`  
Cat

# Implicit upward cast

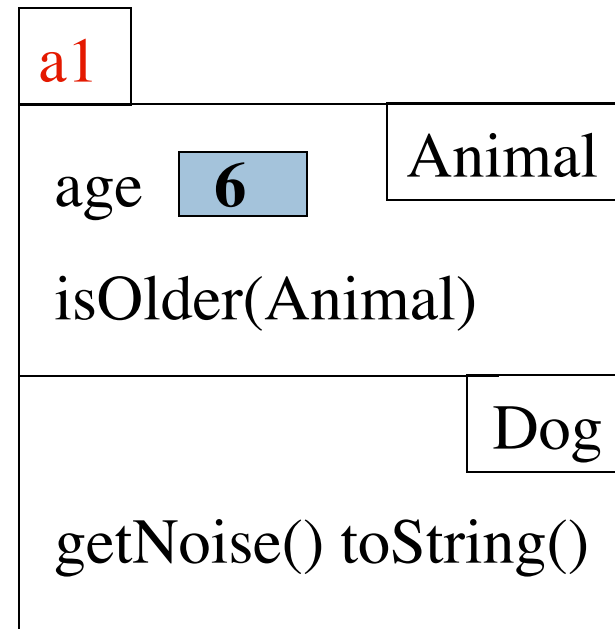

21

```
public class Animal {  
    /** = "this Animal is older than h" */  
    public boolean isOlder(Animal h) {  
        return age > h.age;  
    }  
}
```

Call `c.isOlder(d)`

Variable `h` is created. `a1` is cast up to class `Animal` and stored in `h`

Upward casts done automatically when needed

# Example

22

```
public class Animal {  
    /** = "this is older than h" */  
    public boolean isOlder(Animal h) {  
        return age > h.age;  
    }  
}
```

Type of `h` is `Animal`. Syntactic property.

Determines at compile-time what components can be used: those available in `Animal`

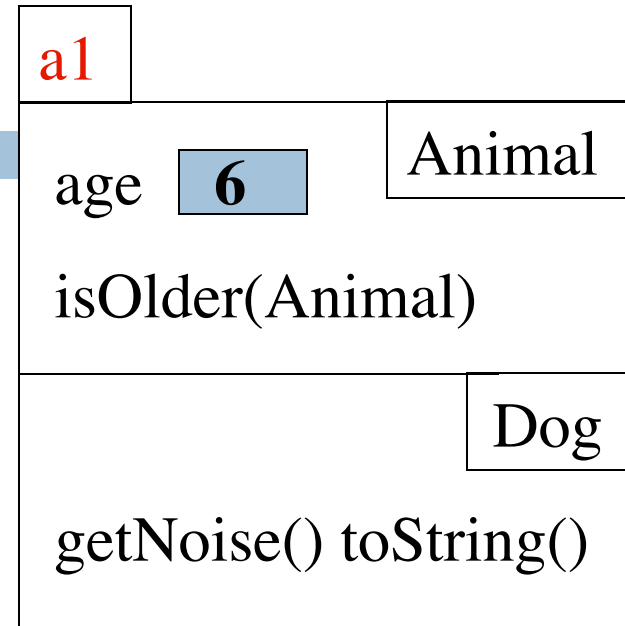

If a method call is legal, the overriding rule determines which implementation is called

`h` `a1`  
Animal

# Components used from h

23

```
public class Animal {  
    /** = "this is older than h" */  
    public boolean isOlder(Animal h) {  
        return age > h.age;  
    }  
}
```

h.toString() OK —it's in class **Object** partition  
h.isOlder(...) OK —it's in **Animal** partition  
h.getWeight() **ILLEGAL** —not in **Animal**  
partition or **Object** partition

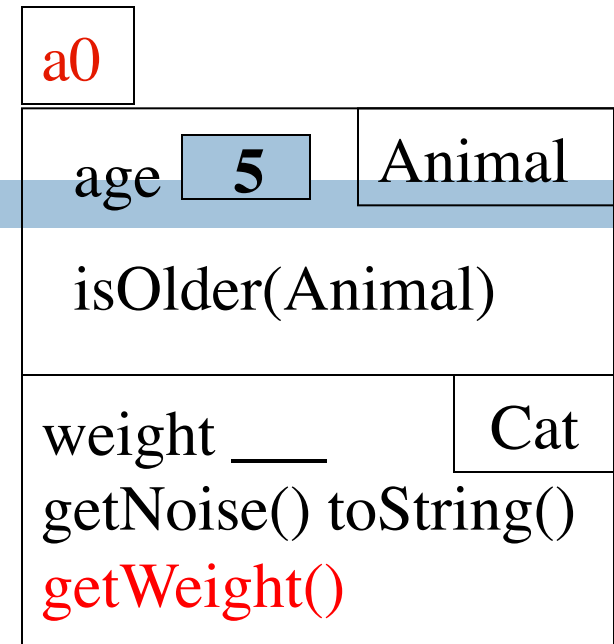

By overriding  
rule, calls  
toString() in  
Dog partition

h a1  
Animal

# Explicit downward cast

24

```
public class Cat extends Animal {  
    private float weight;  
    /** return true iff ob is a Cat and its  
     * fields have same values as this */  
    public boolean equals(Object ob) {  
        ?  
        // { h is a Cat }  
        if ( ! super.equals(ob) ) return false;  
        Cat c= (Cat) ob ; // downward cast  
        return weight == c.getWeight();  
    }  
}
```

**(Dog) ob** leads to runtime error.

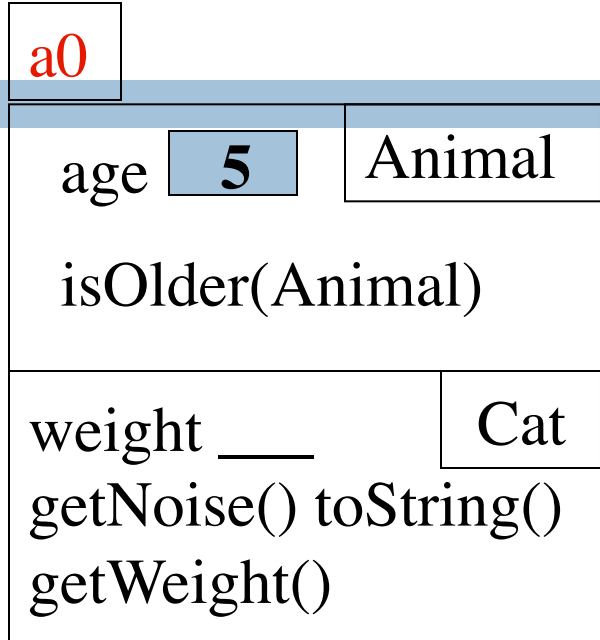

Don't try to cast an object to something that it is not!

# Operator instanceof, explicit down cast

25

```
public class Cat extends Animal {  
    private float weight;  
    /** return true iff ob is a Cat and its  
     * fields have same values as this */  
    public boolean equals(Object ob) {  
        if ( ! (ob instanceof Cat) ) return false;  
        // { h is a Cat }  
        if ( ! super.equals(ob) ) return false;  
        Cat c= (Cat) ob ; // downward cast  
        return weight == c.getWeight();  
    }  
}
```

h a0  
Animal

**<object> instanceof <class-name>**

true iff <object> has a partition for <class-name>

# Opinions about casting

26

- Use of instanceof and downcasts can indicate bad design

DON'T:

```
if (x instanceof C1)
    do thing with (C1) x
else if (x instanceof C2)
    do thing with (C2) x
else if (x instanceof C3)
    do thing with (C3) x
```

DO:

```
x.do()
```

(dothing overridden in C1, C2, C3)

- But how do I implement equals() ?

That requires casting
