SPRING 2018

Lecture 6: Consequence of type, casting, function equals
<http://courses.cs.cornell.edu/cs2110>

2

Overview references in JavaHyperText

- Quick look at arrays array
- Casting among classes cast, object-casting rule
- Operator instanceof
- Function getClass
- Function equals
- compile-time reference rule

Homework. JavaHyperText while-loop for-loop

while (<bool expr>) { ... } // syntax

for (int k= 0; k < 200; k= k+1) { ... } // example

3

A2 is due Thursday

Everyone should get 100/100 since we gave you all the test cases you need.

Please look at the pinned Piazza note "Assignment A2" for information that is not in the handout and answers to questions.

4

Before Next Lecture...

Follow the tutorial on **abstract classes and interfaces**, and watch less than 13 minutes of videos.

Visit JavaHyperText and click on **Abstract classes and interfaces**

This will make Thursday's lecture far more understandable.

5

Classes we work with today

Work with a class **Animal** and subclasses like **Cat** and **Dog**

Put components common to animals in **Animal**

class hierarchy:

```

graph TD
    Object --> Animal
    Animal --> Dog
    Animal --> Cat
            
```

a0	age 5	Animal
isOlder(Animal)		
getNoise() toString()		Cat
getPurrs()		

a1	age 6	Animal
isOlder(Animal)		
getNoise() toString()		Dog

Object partition is there but not shown

6

Animal[] v= new Animal[3];

declaration of array v

Create array of 3 elements

Assign value of new-exp to v

Assign and refer to elements as usual:

```

v[0]= new Animal(...);
...
a= v[0].getAge();
            
```

Sometimes use horizontal picture of an array:

v	null	a6
	a6	Animal[]
0	null	
1	null	
2	null	

v	0	1	2
	null	null	null

Consequences of a class type

Animal[] v; declaration of v. Also means that each variable v[k] is of type Animal

The type of v is Animal[]
 The type of each v[k] is Animal
 The type is part of the syntax/grammar of the language. Known at compile time.

v	0	1	2
	a0	null	a1

Animal objects

A variable's type:

- Restricts what values it can contain.
- Determines which methods are legal to call on it.

Dog and Cat objects stored in Animal variable

Which function is called by v[0].toString() ?

(Remember, the hidden Object partition contains toString().)

Can store (pointers to) subclass objects in superclass variable

v	0	1	2
	a0	null	a1

age	5	Animal
isOlder(Animal)		
Cat		
toString() getNoise() getPurrs()		

age	6	Animal
isOlder(Animal)		
Dog		
toString() getNoise()		

Bottom-up or overriding rule says function toString in Cat partition

Compile-time reference rule: From a variable of type C, can reference only methods/fields that are available in class C.

a.getPurrs() is obviously illegal. The compiler will give you an error.

From an Animal variable, can use only methods available in class Animal

When checking legality of a call like a.getPurrs(...) since the type of a is Animal, method getPurrs must be declared in Animal or one of its superclasses.

see JavaHyperText: compile-time reference rule

a	a0	Animal
---	----	--------

a0	age 5	Animal
isOlder(Animal)		
Dog		
getNoise() toString()		

Compile-time reference rule: From a variable of type C, can reference only methods/fields that are available in class C.

Suppose a0 contains an object of a subclass Cat of Animal. By the compile-time reference rule below, a.getPurrs(...) is still illegal. Remember, the test for legality is done at compile time, not while the program is running.

When checking legality of a call like a.getPurrs(...) since the type of a is Animal, method getPurrs must be declared in Animal or one of its superclasses.

see JavaHyperText: compile-time reference rule

a	a0	Animal
---	----	--------

a0	age 5	Animal
isOlder(Animal)		
Cat		
getNoise() toString() getPurrs()		

Compile-time reference rule: From a variable of type C, can reference only methods/fields that are available in class C.

The same object a0, from the viewpoint of a Cat variable and an Animal variable

c.getPurrs() is legal

a.getPurrs() is illegal because getPurrs is not available in class Animal

c	a0	Cat
---	----	-----

a0	age 5	Animal
isOlder(Animal)		
Cat		
getNoise() toString() getPurrs()		

a0	age 5	Animal
isOlder(Animal)		
Cat		
getNoise() toString() getPurrs()		

Compile-time reference rule: From a variable of type C, can reference only methods/fields that are available in class C.

Rule: c.m(...) is legal and the program will compile ONLY if method m is declared in C or one of its superclasses. (JavaHyperText entry: compile-time reference rule.)

m(...) must be declared in one of these classes

c	a0	C
---	----	---

a0	Object
...	
...	
C	

Another example

13

Type of v[0]: Animal

Should this call be allowed?
Should program compile?

v[k].getPurrs()

Should this call be allowed?
Should program compile?

v[0].getPurrs()

v	0	1	2
	a0	null	a1

a0	age 5 Animal	a1	age 6 Animal
	isOlder(Animal)		isOlder(Animal)
	Cat		Dog
	getNoise() toString() getPurrs()		getNoise() toString()

View of object based on the type

14

Each element v[k] is of type Animal.

From v[k], see only what is in partition Animal and partitions above it.

getPurrs() not in class Animal or Object. Calls are illegal, program does not compile.

v[0].getPurrs() v[k].getPurrs()

Components are in lower partitions, but can't see them

v	0	1	2
	a0	null	a1

a0	age 5 Animal	a1	age 6 Animal
	isOlder(Animal)		isOlder(Animal)
	Cat		Dog
	getNoise() toString() getPurrs()		getNoise() toString()

Casting objects

15

You know about casts like:

(int) (5.0 / 7.5)

(double) 6

double d = 5; // automatic cast

You can also use casts with class types:

Animal h = new Cat("N", 5);

Cat c = (Cat) h;

A class cast doesn't change the object. It just changes the perspective: how it is viewed!

```

graph TD
    Object --> Animal
    Animal --> Dog
    Animal --> Cat
    
```

a0	age 5 Animal	a1	age 6 Animal
	isOlder(Animal)		isOlder(Animal)
	Cat		Dog
	getNoise() toString() getPurrs()		getNoise() toString()

Explicit casts: unary prefix operators

16

Object-casting rule: At runtime, an object can be cast to the name of any partition that occurs within it—and to nothing else. a0 can be cast to Object, Animal, Cat.

An attempt to cast it to anything else causes an exception

(Cat) c

(Object) c

(Animal) (Animal) (Cat) (Object) c

These casts don't take any time. The object does not change. It's a change of perception.

a0	equals() ... Object
	age 5 Animal
	isOlder(Animal)
	Cat
	getNoise() toString() getPurrs()

c a0
Cat

Implicit upward cast

17

```

public class Animal {
    /** = "this Animal is older than h" */
    public boolean isOlder(Animal h) {
        return age > h.age;
    }
}
    
```

Call c.isOlder(d)

Variable h is created. a1 is cast up to class Animal and stored in h

Upward casts done automatically when needed

h a1 Animal c a0 Cat d a1 Dog

a0	age 5 Animal	a1	age 6 Animal
	isOlder(Animal)		isOlder(Animal)
	Cat		Dog
	getNoise() toString() getPurrs()		getNoise() toString()

Function h.equals(ob)

20

Function h.equals(ob) returns true if objects h and ob are equal, where equality depends on the class. Here, we mean all corresponding fields are equal.

h a0
k a1
j a2

h.equals(h): true	a0.equals(a0): true
h.equals(k): true	a0.equals(a1): true
h.equals(j): false	a0.equals(a2): false

Not Java

a2	age 3 An	a1	age 5 An	a0	age 5 An
	equals(Object)		equals(Object)		equals(Object)

Function h.equals(ob)

21

Function h.equals(ob) returns true if objects h and ob are equal, where equality depends on the class. Here, we mean all corresponding fields are equal.

a0.equals(a0): true
 a0.equals(a1): false
 a0.equals(a2): false

a2	a1	a0
age_3_ An	age_2_ An	age_5_ An
equals(Object)	equals(Object)	equals(Object)
noise_”q”_Cat	noise_”p”_Cat	noise_”p”_Cat
equals(Object)	equals(Object)	equals(Object)

Function h.equals(ob)

22

Function h.equals(ob) returns true if objects h and ob are equal, where equality depends on the class. Here, we mean all corresponding fields are equal.

This function checks equality of age

This function

- (1) Calls superclass equality
- (2) checks equality of noise

a0
age_5_ An
equals(Object)
noise_”p”_Cat
equals(Object)

Function h.equals(ob)

23

Function h.equals(ob) returns true if objects h and ob are equal, where equality depends on the class. Here, we mean all corresponding fields are equal.

**What is value of a1.equals(a0)?
a0.equals(a1)?**

Obviously, h.equals(ob) has to check that the classes of h and ob are the same

This function checks equality of age

This function

- (1) Calls super-class equality
- (2) checks equality of noise

a1	a0
age 5 An	age_5_ An
equals(Object)	equals(Object)
noise_”p”_Cat	noise_”p”_Cat
equals(Object)	equals(Object)

Function h.equals(ob)

24

- (1) Check classes of this and parameter
- (2) Check age of this and parameter

- (1) Call super-class equality
- (3) Check equality of noise

- (1) Call super-class equality
- (3) Check equality of noise

a0
age_5_ An
equals(Object)
noise_”p”_Cat
equals(Object)
f_8_ Siamese
equals(Object)

Use function getClass

25

h.getClass()

Let Cat be the lowest partition of object h
 Then h.getClass == Cat.class
 h.getClass != Animal.class

a0
age 5 Animal
isOlder(Animal)
purrs _____ Cat
getNoise() toString() getPurrs()

h a0
Animal

Equals in Animal

26

```

public class Animal {
    private int age;
    /** return true iff this and ob are of the same class
     * and their age fields have same values */
    public boolean equals(Object ob) {
        if (ob == null || getClass() != ob.getClass()) return false;
        Animal an= (Animal) ob; // cast ob to Animal!!!!
        return age == an.age; // downcast was needed to reference age
    }
}
    
```

a0
age 5 Animal
equals(Object)

Equals in Cat

```

27 public class Animal {
    private int age;
    /** return true iff this and ob are of same class
     * and their age fields have same values */
    public boolean equals(Object ob) {}
}

public class Cat extends Animal {
    private int age;
    /** return true iff this and ob are of same class
     * and their age and noise fields have same values */
    public boolean equals(Object ob) {}
    if (!super.equals(ob)) return false;
    Cat ca= (Cat) ob; // downcast is necessary!
    return noise == ca.noise; // needed to reference noise
}
    
```

Use operator instanceof

```

28 ob instanceof C

true iff ob has a partition named C

h instanceof Object true
h instanceof Animal true
h instanceof Cat true
h instanceof JFrame false
    
```

Opinions about casting

Use of instanceof and downcasts can indicate bad design

```

DONT:
if (x instanceof C1)
do thing with (C1) x
else if (x instanceof C2)
do thing with (C2) x
else if (x instanceof C3)
do thing with (C3) x

DO:
x.do()
... where do is overridden in the
classes C1, C2, C3
    
```

But how do I implement equals() ?

That requires casting!
