Lecture 21: Logic, part II

To Truth through Proof

Prof. Clarkson

Fall 2014

Today's music: "The Devil went down to Georgia"
by The Charlie Daniels Band

Review

Current topic:

- How to reason about correctness of code
- Last week: informal arguments

Today:

- Logic, part II
- Upgrade from *propositional* logic to *predicate* logic

Question #1

How much of PS5 have you finished?

- A. None
- B. About 25%
- C. About 50%
- D. About 75%
- E. I'm done!!!

Review: A biased perspective on logic

- A *logic* is a programming language for expressing reasoning about **evidence**
- Like any PL, a logic has
 - **syntax**
 - **dynamic semantics** (evaluation rules) --omitted here
 - **static semantics** (type checking)

Review: IPC

IPC= Intuitionistic Propositional Calculus

Syntax:

$$f ::= P \mid f1 \wedge f2 \mid f1 \vee f2$$
$$\mid f1 \Rightarrow f2 \mid \sim f$$
$$P ::= \text{true} \mid \text{false} \mid \dots$$

Review: Proof rules so far

Rule name	Rule
\wedge intro	if $\mathbf{F} \vdash \mathbf{f1}$ and $\mathbf{F} \vdash \mathbf{f2}$ then $\mathbf{F} \vdash \mathbf{f1} \wedge \mathbf{f2}$
\wedge elim L	if $\mathbf{F} \vdash \mathbf{f1} \wedge \mathbf{f2}$ then $\mathbf{F} \vdash \mathbf{f1}$
\wedge elim R	if $\mathbf{F} \vdash \mathbf{f1} \wedge \mathbf{f2}$ then $\mathbf{F} \vdash \mathbf{f2}$
\Rightarrow elim	if $\mathbf{F} \vdash \mathbf{f}$ and $\mathbf{F} \vdash \mathbf{f} \Rightarrow \mathbf{g}$ then $\mathbf{F} \vdash \mathbf{g}$
\Rightarrow intro	if $\mathbf{F}, \mathbf{f} \vdash \mathbf{g}$ then $\mathbf{F} \vdash \mathbf{f} \Rightarrow \mathbf{g}$
assump	$\mathbf{f} \vdash \mathbf{f}$
weak	if $\mathbf{F} \vdash \mathbf{f}$ then $\mathbf{F}, \mathbf{g} \vdash \mathbf{f}$
set assump	$\mathbf{F}, \mathbf{f} \vdash \mathbf{f}$

Evidence for **true** and **false**

Q: What constitutes evidence for **true**?

A: We don't need any; **true** trivially holds

Q: What constitutes evidence for **false**?

A: Nothing; **false** can never hold.

*If we ever did somehow have evidence for **false**, then we'd be in a contradictory situation, and all reason has broken down.*

Proof rules for true and false

- $\mathbb{F} \vdash \text{true}$
 - only an introduction rule, no elimination
 - another axiom
 - intuition: we can always give evidence for true
- if $\mathbb{F} \vdash \text{false}$ then $\mathbb{F} \vdash \mathbb{f}$
 - *ex falso quodlibet*: "from false follows whatever you please"
 - Principle of Explosion
 - only an elimination rule, no introduction
 - intuition: we can never give evidence for **false**; but once we can conclude **false**, we can conclude anything

Evidence for \sim

Q: What constitutes evidence for $\sim \mathbf{f}$?

A: Since $\sim \mathbf{f}$ really means $\mathbf{f} \Rightarrow \mathbf{false}$, it would be a way of transforming evidence for \mathbf{f} into evidence for false. That is, a way of reaching a contradiction.

Proof rules for \sim

Negation is just syntactic sugar, so free to convert between those two forms:

- if $\mathbb{F} \vdash \mathbf{f} \Rightarrow \mathbf{false}$ then $\mathbb{F} \vdash \sim \mathbf{f}$
 - intuition: if there's a way to transform evidence for \mathbf{f} into evidence for \mathbf{false} , then you have evidence for $\sim \mathbf{f}$
- if $\mathbb{F} \vdash \sim \mathbf{f}$ then $\mathbb{F} \vdash \mathbf{f} \Rightarrow \mathbf{false}$
 - intuition: if you have evidence for $\sim \mathbf{f}$, then you have a way of transforming evidence for \mathbf{f} into evidence for \mathbf{false}

Evidence for $\setminus /$

Q: What constitutes evidence for $\mathbf{f1} \setminus / \mathbf{f2}$?

A: Evidence for either $\mathbf{f1}$ or for $\mathbf{f2}$, tagged to indicate which one it's evidence for.

So evidence for $\mathbf{f1} \setminus / \mathbf{f2}$ is really a value of a **datatype**:

```
type ('a, 'b) sum =
```

```
  Left of 'a | Right of 'b
```

Proof rules for $\setminus /$

- if $\mathbf{F} \vdash \mathbf{f1}$ then $\mathbf{F} \vdash \mathbf{f1} \setminus / \mathbf{f2}$
- if $\mathbf{F} \vdash \mathbf{f2}$ then $\mathbf{F} \vdash \mathbf{f1} \setminus / \mathbf{f2}$
 - intuition: if you have evidence for $\mathbf{f1}$, then you have evidence for $\mathbf{f1} \setminus / \mathbf{f2}$
 - further intuition: these rules are really just constructor application

Proof rules for $\backslash/$

- if $\mathbb{F} \vdash f1 \backslash/ f2$ and $\mathbb{F} \vdash f1 \Rightarrow g$
and $\mathbb{F} \vdash f2 \Rightarrow g$ then $\mathbb{F} \vdash g$
 - intuition: if you have evidence for $f1 \backslash/ f2$, and if you have a way of transforming evidence for $f1$ into evidence for g , as well as for $f2$ into g , then you can obtain evidence for g
 - further intuition: this rule is really just pattern matching!
match s with
 - Left f1 -> e1**
 - | Right f2 -> e2**

Proof with $\backslash/$

Let's show $\vdash (P \backslash/ Q) \Rightarrow (Q \backslash/ P)$

1. $P \backslash/ Q \vdash P \backslash/ Q$ by assump
2. $P \vdash P$ by assump
3. $P \vdash Q \backslash/ P$ by (2) and $\backslash/$ intro R
4. $\vdash P \Rightarrow Q \backslash/ P$ by (3) and \Rightarrow intro
5. $P \backslash/ Q \vdash P \Rightarrow Q \backslash/ P$ by (4) and weak.
6. $Q \vdash Q$ by assump
7. $Q \vdash Q \backslash/ P$ by (6) and $\backslash/$ intro L
8. $\vdash Q \Rightarrow Q \backslash/ P$ by (7) and \Rightarrow intro
9. $P \backslash/ Q \vdash Q \Rightarrow Q \backslash/ P$ by (8) and weak.
10. $P \backslash/ Q \vdash Q \backslash/ P$ by (1), (5), (9) and $\backslash/$ elim
11. $\vdash (P \backslash/ Q) \Rightarrow (Q \backslash/ P)$ by \Rightarrow intro

Tree form

$$\frac{}{\mid - (P \setminus / Q) \Rightarrow (Q \setminus / P)} \Rightarrow \text{intro}$$

$$\mid - (P \setminus / Q) \Rightarrow (Q \setminus / P)$$

As an OCaml program

```
let or_comm (s: ('p, 'q) sum) : ('q, 'p) sum =  
  match s with  
    Left p -> Right p  
  | Right q -> Left q
```

How to think about this program:

`or_comm` is a function that takes in evidence for either `'p` or `'q`, and returns evidence for either `'q` or `'p`

As an OCaml program

```
let or_comm (s: ('p, 'q) sum) : ('q, 'p) sum =  
  match s with  
    Left p -> Right p  
  | Right q -> Left q
```

What is its type?

`('p, 'q) sum -> ('q, 'p) sum`

imagine we could write `sum` as infix `+`...

`'p + 'q -> 'q + 'p`

What is the formula we proved?

$(P \ \backslash / \ Q) \Rightarrow (Q \ \backslash / \ P)$

What about $P \setminus / (\sim P)$?

- aka *excluded middle*
- Many presentations of logic simply assume this holds for any proposition P
 - Indeed, for any formula \mathbf{f}
- **Cannot be proved in IPC**
- But we could add $\vdash P \setminus / (\sim P)$ to IPC to get a new logic, CPC
 - CPC has same **syntax** as IPC, but **type system** that's "bigger" by one rule
 - Then we'd be saying there's always a way to give evidence for either P , or for $P \Rightarrow \mathbf{false}$.
 - But we wouldn't be saying what that evidence is...

A dark, shadowy figure in a long, flowing dress stands against a textured, light-colored background. The figure is mostly obscured by deep shadows, with only a few highlights defining its form. The dress is long and tapers towards the bottom. The background has a mottled, aged appearance with some faint lines and discolorations. The overall mood is mysterious and dark.

The Devil's Middle

Classical vs. constructive

- Without excluded middle we have *constructive logic*
 - Constructive \cong intuitionistic
 - A *constructive* proof is an algorithm (cf. the programs we've been writing that correspond to proofs)
- With it, we have *classical logic*
 - CPC = classical propositional calculus
- Truth vs. proof
 - Truth:
 - Classical proofs are concerned with truth values
 - All propositions are either true or false
 - Proof:
 - Constructive proofs are concerned with evidence
 - Propositions don't have "truth values"; rather, their truth is unknown until can be (dis)proved

Proof rules of IPC, part 1

Rule name	Rule
\wedge intro	if $\mathbb{F} \vdash f1$ and $\mathbb{F} \vdash f2$ then $\mathbb{F} \vdash f1 \wedge f2$
\wedge elim L	if $\mathbb{F} \vdash f1 \wedge f2$ then $\mathbb{F} \vdash f1$
\wedge elim R	if $\mathbb{F} \vdash f1 \wedge f2$ then $\mathbb{F} \vdash f2$
\Rightarrow elim	if $\mathbb{F} \vdash f$ and $\mathbb{F} \vdash f \Rightarrow g$ then $\mathbb{F} \vdash g$
\Rightarrow intro	if $\mathbb{F}, f \vdash g$ then $\mathbb{F} \vdash f \Rightarrow g$
assump	$f \vdash f$
weak	if $\mathbb{F} \vdash f$ then $\mathbb{F}, g \vdash f$
set assump	$\mathbb{F}, f \vdash f$

Proof rules of IPC, part 2

Rule name	Rule
\vee intro L	if $\mathbf{F} \vdash f1$ then $\mathbf{F} \vdash f1 \vee f2$
\vee intro R	if $\mathbf{F} \vdash f2$ then $\mathbf{F} \vdash f1 \vee f2$
\vee elim	if $\mathbf{F} \vdash f1 \vee f2$ and $\mathbf{F} \vdash f1 \Rightarrow g$ and $\mathbf{F} \vdash f2 \Rightarrow g$ then $\mathbf{F} \vdash g$
true intro	$\mathbf{F} \vdash \mathbf{true}$
false elim	if $\mathbf{F} \vdash \mathbf{false}$ then $\mathbf{F} \vdash f$
\sim intro	if $\mathbf{F} \vdash f \Rightarrow \mathbf{false}$ then $\mathbf{F} \vdash \sim f$
\sim elim	if $\mathbf{F} \vdash \sim f$ then $\mathbf{F} \vdash f \Rightarrow \mathbf{false}$

Natural deduction

- Style of proof system we just gave is called *natural deduction*
 - Gentzen (1934), Prawitz (1965)
 - Very few axioms, mostly *inference rules*
 - With intro and elim rules for each connective
- Graphical notation for proof trees is considered a strength of this style
 - Even if it doesn't work well in slides! 😊
 - Even if it doesn't scale well to large proofs!
- In notes and in recitation: larger examples of proofs

Formalize this argument

- All squares are positive
- 9 is a square
- Therefore 9 is positive

Formalize this argument

- All squares are positive **f**
- 9 is a square **g**
- Therefore 9 is positive **h**

an attempt: **f** /\ **g** => **h**

...but that's not a provable formula

...so we might have trouble proving that
the return value of **square** is positive!

...we need *predicates*

Predicates

- *Predicates* aka *relations* upgrade propositions to have arguments:
 - `is_positive(x)`
 - `is_square(x)`
 - `equals(x, y)`, usually written $\mathbf{x=y}$
- *Objects* (the variables above) are the atomic things we now talk about
 - might be integers, lists of strings, real numbers, etc.
- *Functions* map between objects
 - `square(3)`, which is 9
- *Quantifiers* let us talk about all objects at once:
 - "for all objects x , it holds that $\mathbf{P(x)}$ " (universal)
 - "there exists an object x , such that $\mathbf{P(x)}$ holds" (existential)

A new logic: IQC

Syntax:

$$\begin{aligned} \mathbf{f} ::= & \mathbf{P}(t_1, \dots, t_n) \\ & | \mathbf{f}_1 \wedge \mathbf{f}_2 \quad | \quad \mathbf{f}_1 \vee \mathbf{f}_2 \\ & | \mathbf{f}_1 \Rightarrow \mathbf{f}_2 \quad | \quad \sim \mathbf{f} \\ & | \text{forall } x, \mathbf{f} \\ & | \text{exists } x, \mathbf{f} \\ \mathbf{t} ::= & x \quad | \quad \mathbf{fn}(t_1, \dots, t_n) \end{aligned}$$

- \mathbf{P} is a meta-variable for predicates/relations (incl. *nullary* predicates **true** and **false**)
- \mathbf{t} is a meta-variable for *terms*, including constants, variables, and functions **fn** applied to terms (including *nullary* functions, i.e., constants)

IQC

- IQC = Intuitionistic Quantifier Calculus
- CQC = Classical Quantifier Calculus
 - equals IQC + excluded middle
- CQC aka
 - first order logic (FOL)
 - predicate logic
 - predicate calculus

Formalize this argument

- All squares are positive `forall x,`
`is_square(x) => is_positive(x)`
- 9 is a square `is_square(9)`
- Therefore 9 is positive `is_positive(9)`

```
((forall x, is_square(x) => is_positive(x))  
 /\ is_square(9))  
=> is_positive(9)
```

Proof rules for IQC

- All the rules of IPC, plus intro and elim for quantifiers
- New notation:
 - $\mathbf{f}(\mathbf{x})$ means a formula \mathbf{f} that mentions a variable \mathbf{x}
 - $\mathbf{f}(\mathbf{t})$ means that same formula \mathbf{f} , but with all mentions of \mathbf{x} replaced by term \mathbf{t}

Evidence for forall

Q: What constitutes evidence for **forall x , $f(x)$** ?

A: A way of producing evidence for **$f(x)$** out of an arbitrary object **x** .

...That is, a way of transforming an object **x** into evidence of **$f(x)$**

(note the similarity to \Rightarrow)

Proof rules for forall

- if $\mathbb{F} \vdash f(x)$ and \mathbb{F} does not make any assumptions about x , then $\mathbb{F} \vdash \text{forall } x, f(x)$
 - introduction rule
 - **intuition:** if you can construct evidence for $f(x)$ without making any assumptions about x , then you have a way of transforming x into evidence for $f(x)$
- ...but what does "make assumptions about" mean?

Free variables

Free variables are variables that aren't bound by any quantifier

- $P(\mathbf{x})$: \mathbf{x} is free
- $\text{forall } \mathbf{x}, P(\mathbf{x}) \wedge Q(\mathbf{y})$: \mathbf{x} is not free and \mathbf{y} is free
- $R(\mathbf{x}) \Rightarrow (\text{forall } \mathbf{x}, P(\mathbf{x}))$: \mathbf{x} is free in LHS of implication, but not in RHS

If \mathbf{x} does not occur free in a formula, then the formula makes no assumptions about it.

Likewise for a set of formulae.

Free variables (formal defn)

$$FV(x) = \{x\}$$

$$FV(f(t_1, \dots, t_n)) = FV(t_1) \cup \dots \cup FV(t_n)$$

$$FV(P(t_1, \dots, t_n)) = FV(t_1) \cup \dots \cup FV(t_n)$$

$$FV(f_1 / f_2) = FV(f_1) \cup FV(f_2)$$

$$FV(f_1 \Rightarrow f_2) = FV(f_1) \cup FV(f_2)$$

$$FV(f_1 \setminus / f_2) = FV(f_1) \cup FV(f_2)$$

$$FV(\sim f) = FV(f)$$

$$FV(\text{forall } x, f) = FV(f) \setminus \{x\}$$

$$FV(\text{exists } x, f) = FV(f) \setminus \{x\}$$

Proof rules for forall

- if $\mathbf{F} \vdash \mathbf{f}(\mathbf{x})$ and \mathbf{x} does not *occur free* in \mathbf{F} , then $\mathbf{F} \vdash \text{forall } \mathbf{x}, \mathbf{f}(\mathbf{x})$
 - introduction rule
 - " \mathbf{x} does not *occur free* in \mathbf{F} " means \mathbf{x} not in $\mathbf{FV}(\mathbf{f})$ for any \mathbf{f} in \mathbf{F}
 - **intuition:** if you can construct evidence for $\mathbf{f}(\mathbf{x})$ without making any assumptions about \mathbf{x} , then you have a way of transforming \mathbf{x} into evidence for $\mathbf{f}(\mathbf{x})$

Proof rules for forall

- if $F \vdash \text{forall } x, f(x)$, then $F \vdash f(t)$
 - elimination rule
 - **intuition:** if you have a way of transforming any x into evidence for $f(x)$, then you can use that to produce evidence for $f(t)$ out of t

Proof with forall

Let's show $\vdash (\text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x})) \Rightarrow (\text{forall } \mathbf{x}, R(\mathbf{x})) \wedge (\text{forall } \mathbf{x}, Q(\mathbf{x}))$

1. $\text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x}) \vdash \text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x})$ by
assump.
2. $\text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x}) \vdash R(\mathbf{x}) \wedge Q(\mathbf{x})$ by (1) and forall elim.
3. $\text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x}) \vdash R(\mathbf{x})$ by (2) and \wedge elim L
4. $\text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x}) \vdash \text{forall } \mathbf{x}, R(\mathbf{x})$ by (3) and forall intro*
5. $\text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x}) \vdash Q(\mathbf{x})$ by (2) and \wedge elim R
6. $\text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x}) \vdash \text{forall } \mathbf{x}, Q(\mathbf{x})$ by (5) and forall intro*
7. $\text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x}) \vdash (\text{forall } \mathbf{x}, R(\mathbf{x})) \wedge (\text{forall } \mathbf{x}, Q(\mathbf{x}))$ by (4), (6) and \wedge intro
8. $\vdash (\text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x})) \Rightarrow (\text{forall } \mathbf{x}, R(\mathbf{x})) \wedge (\text{forall } \mathbf{x}, Q(\mathbf{x}))$ by (7) and \Rightarrow intro.

* \mathbf{x} does not occur free in LHS

Tree form

$\frac{}{\text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x})} \text{assump.}$ $\text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x})$	$\frac{}{\text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x})} \text{assump.}$ $\text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x})$

$\frac{}{\text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x})} \Rightarrow \text{intro}$ $\text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x}) \Rightarrow$ $\text{forall } \mathbf{x}, R(\mathbf{x}) \wedge Q(\mathbf{x})$	

* \mathbf{x} does not occur free in LHS

Note: bad formatting! hard to fit on slide ☹️

As an OCaml program?

- OCaml's type system is not quite expressive enough to give a program whose type is that formula
 - In part, reason for that is to get good type inference
- Languages with richer type systems can do it
 - See CS 4110/6110
- Same will be true of existentials...

Evidence for `exists`

Q: What constitutes evidence for `exists x, f(x)`?

A: A *witness* object `w`, along with evidence for `f(w)`.

Proof rules for exists

- if $F \vdash f(t)$ then $F \vdash \text{exists } x, f(x)$
 - introduction rule
 - **intuition:** if you can construct evidence for $f(t)$ then t is a witness.

Proof rules for exists

- if $\mathbf{F} \vdash \text{exists } \mathbf{x}, \mathbf{f}(\mathbf{x})$ and $\mathbf{F} \vdash \mathbf{f}(\mathbf{x}) \Rightarrow \mathbf{g}$ and \mathbf{x} does not occur free in \mathbf{F} or \mathbf{g} , then $\mathbf{F} \vdash \mathbf{g}$
 - elimination rule
 - **intuition:** if you have a witness \mathbf{w} for $\mathbf{f}(\mathbf{w})$, and if you have a way of transforming evidence for $\mathbf{f}(\mathbf{x})$ into evidence for \mathbf{g} , and if there are no assumptions about \mathbf{x} , then you can use \mathbf{w} in place of \mathbf{x} to get evidence for \mathbf{g} .

Proof with exists

Let's show $\vdash (\text{exists } x, Q(x) \ \backslash / \ R(x)) \Rightarrow (\text{exists } x, Q(x)) \ \backslash / \ (\text{exists } x, R(x))$

1. $Q(x) \vdash Q(x)$ by *assump.*
2. $Q(x) \vdash \text{exists } x, Q(x)$ by (1) and *exists intro*
3. $Q(x) \vdash (\text{exists } x, Q(x)) \ \backslash / \ (\text{exists } x, R(x))$ by (2) and $\backslash /$ *intro L*
4. $\vdash Q(x) \Rightarrow (\text{exists } x, Q(x)) \ \backslash / \ (\text{exists } x, R(x))$ by (3) and \Rightarrow *intro*
5. $Q(x) \ \backslash / \ R(x) \vdash Q(x) \Rightarrow (\text{exists } x, Q(x)) \ \backslash / \ (\text{exists } x, R(x))$ by (4) and *weak.*
6. $Q(x) \ \backslash / \ R(x) \vdash R(x) \Rightarrow (\text{exists } x, Q(x)) \ \backslash / \ (\text{exists } x, R(x))$ by *repeat (1–5) with R*
7. $Q(x) \ \backslash / \ R(x) \vdash Q(x) \ \backslash / \ R(x)$ by *assump.*
8. $Q(x) \ \backslash / \ R(x) \vdash (\text{exists } x, Q(x)) \ \backslash / \ (\text{exists } x, R(x))$ by $\backslash /$ *elim* using (7), (5), (6)
9. $\vdash Q(x) \ \backslash / \ R(x) \Rightarrow (\text{exists } x, Q(x)) \ \backslash / \ (\text{exists } x, R(x))$ by (8) and \Rightarrow *intro*
