

Lecture 6

Uncertainty & Risk

Uncertainty and Risk

- **Risk**: outcome of action is uncertain
 - Perhaps action has random results
 - May depend upon opponent's actions
 - Need to know what opponent will do
- Two primary means of risk in a game
 - Chance and randomness
 - Imperfect information

Uncertainty \neq Skill

- Outcomes may depend on player skill
 - Hand-eye coordination challenges
 - Reaction-time/twitch challenges
 - **Knowledge of optimal strategies**
- Varying skill level \rightarrow uncertain outcomes
 - But challenges themselves are predictable
 - Player can train at challenge over time
 - **Not the subject of this lecture**

Randomness in Games

- Pure randomness is not a good game
 - Remember coin flipping
 - Player has no *meaningful choice*
- But many games **are** random
 - *Candyland, Snakes & Ladders*
 - Poker, other forms of gambling
 - Tetris and other matching, stacking games

Randomness: *Candy Land*

Randomness: Poker

Randomness with Choice

- Tetris pieces are random, but
 - Have a choice in how to position them
 - “Hedge your bets” to prepare for bad drops
- RPG combat is die roll influenced by
 - Armor the defender wears
 - Weapons the attack uses
 - Combat maneuvers employed

Randomness in RPGs

Sheet v2.0 by Democritus - www.dcs-designs.de

Player: _____
Caste: _____

Character Name

Concept: _____
Personality: _____
Description: _____

LOYALTIES

Motivation: _____
Intimacies: _____

Pig: A Random Game

- Play progresses clockwise
- On your turn, throw the die:
 - If roll 1: lose turn, score zero
 - Anything else: add it to score
 - Can also roll again (and lose)
 - If stop, score is “banked”
- First person to 100 wins.

Strategic Randomness

- Pig has **meaningful choice**
 - Player can choose to bank
 - Risk nothing for a higher score
- How is the choice meaningful?
 - Certain decisions are better than others
 - Certain decisions are more *fun* than others
 - Psychological effect on other players

Expected Value

- Outcome of actions is never the same
 - But the sum averages out over many tries
 - Strategy: compare average outcomes
- **Expected Value** = outcome \times % success
 - If many outcomes, sum them together
 - Example: Average die roll is 3.5
$$1 \times \frac{1}{6} + 2 \times \frac{1}{6} + 3 \times \frac{1}{6} + 4 \times \frac{1}{6} + 5 \times \frac{1}{6} + 6 \times \frac{1}{6} = 3.5$$
- Only applies if can do action *repeatedly*

Expected Value of Pig

| # Throws | Survial | Expected Gain | Expected Value |
|----------|---------|---------------|----------------|
| 1 | 83% | 3.33 | 3.33 |
| 2 | 69% | 2.78 | 6.11 |
| 3 | 58% | 2.32 | 8.43 |
| 4 | 48% | 1.92 | 10.35 |
| 5 | 40% | 1.61 | 11.96 |
| 6 | 33% | 1.34 | 13.30 |
| 7 | 28% | 1.12 | 14.42 |
| 8 | 23% | .93 | 15.35 |
| 9 | 19% | .77 | 16.12 |
| 10 | 16% | .65 | 16.77 |
| ... | ... | ... | ... |
| 50 | 0.01% | 0.0004 | 19.998 |

Expected Value and *Warcraft*

Psychology of Randomness

- Players favor **longshots**
 - Rare event that has very high payoff
 - Will work towards it even if not optimal
 - Especially if failure is cheap
- Players have “Monte Carlo syndrome”
 - After a bad run, expect a good result
 - Otherwise, the game is “unfair”

Psychology of Randomness

- **Payoff** influences the perception
 - Players remember events with bigger payoff
 - Will think it is “more likely”
 - Even if two events equally likely
- **Corollary:** Lightning never strikes twice
 - A bad outcome is unlikely to happen again
 - A good outcome will probably happen again

Psychology of Nonrandomness

- Players can view the nonrandom as random
- **Example:** paper-scissors-rock

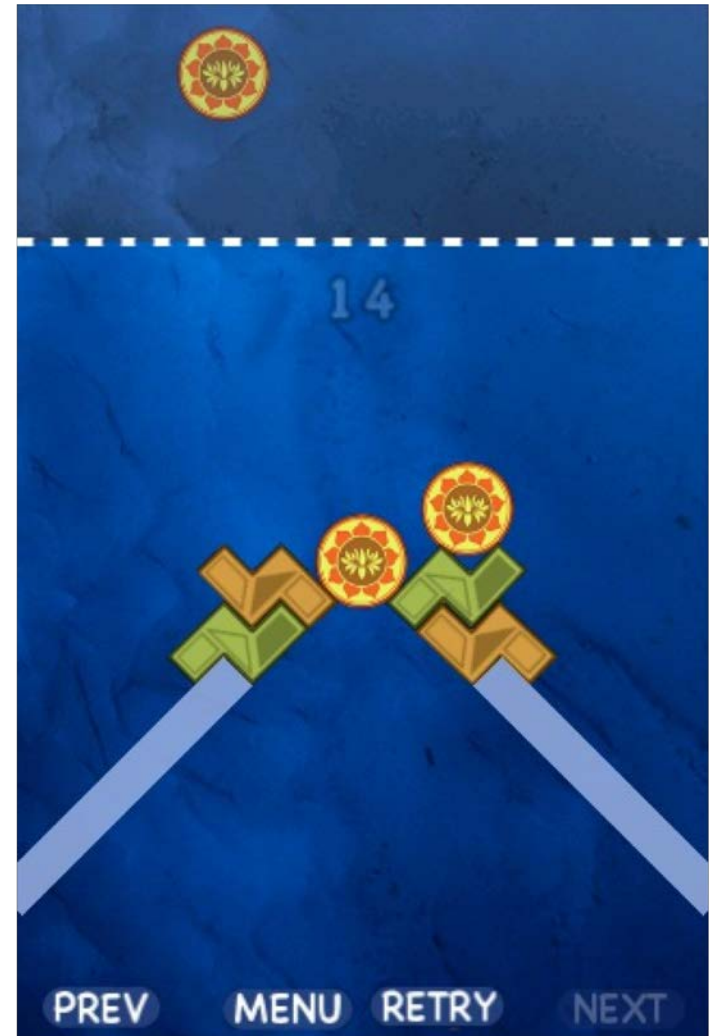

Psychology of Nonrandomness

- Players can view the nonrandom as random
- **Example:** paper-scissors-rock
 - Opponent is *uncertain*, not *random*
 - But there is no choice is better than others
 - How do you choose?
- Any game with heavy negative feedback
- “Random” = lack of meaningful choice

Instability vs. Random

- **Physics** can be sensitive!
 - Small input change = big output change
 - Games can “feel random”
- **Instable challenges**
 - Difficult to repeat success
 - Very difficult to tune
 - But popular trend in modern puzzle games

Imperfect Information

- Player may lack information about that game
 - May not know complete game state
 - May not know all of the rules
- Can reason about *likelihood*
 - Rules eliminate certain possibilities
 - Model opponent psychology
 - But less precise than probability

Example: Fog of War

Making Information Imperfect

- **Hide information**

- Fog of war
- Hidden moves
- Hidden die rolls

- **Generate random noise**

- (Partial) scanner jamming
- Inaccurate troop measurements

Information Types

- Information known to **all players**
- Information known to **one player**
- Information know only to **the game**
 - **Example**: the next card in a deck
- **Randomly** generated information
 - **Example**: die rolls

Information in Clue

Computers and Information

- Very good at **managing** information
 - Can easily hide information from players
- Can hide very **complex** information
 - Humans have hard time hiding and managing
 - Also, too easy to cheat if hidden
- Particularly good at
 - Information known only to **one player**
 - Information know only to **the game**

Randomness vs Imperfect Information

- Randomness used heavily in board games
 - Nice way to introduce uncertainty/risk
 - Easier to manage than imperfect information
- But not as important for computer games
 - Imperfect information is easy to manage
 - Complex rules (physics) may seem random
- **Deterministic** rules are easier to tune
 - Even board games realize this (*Puerto Rico*)

Digital vs. Nondigital Games

Digital Games

- Advantages
 - Hiding Information
 - Complex mechanics
 - Long-distance play
- Disadvantages
 - Adaptability
 - Product life span

Nondigital Games

- Advantages
 - “House Rules”
 - Portability/life span
 - Multiplayer psychology
- Disadvantages
 - Complex mechanics
 - Hidden information

Summary

- Uncertainty and risk are **important**
 - Otherwise player is (eventually) unchallenged
 - No possibility of strategic choice
- Ways of introducing uncertainty/risk
 - Through skill-based challenges
 - Through randomness
 - Through incomplete information
 - Latter is primary strength of computers
