

# Calling Conventions

**Prof. Hakim Weatherspoon**

**CS 3410, Spring 2015**

Computer Science

Cornell University

See P&H 2.8 and 2.12, and A.5-6

# Announcement

## Upcoming agenda

- PA1 due yesterday
- PA2 available and discussed during lab section this week
- PA2 Work-in-Progress due Monday, March 16<sup>th</sup>
- PA2 due Thursday, March 26<sup>th</sup>
- HW2 available next week, due before Prelim2 in April
- Spring break: Saturday, March 28<sup>th</sup> to Sunday, April 5<sup>th</sup>

# Goals for Today

## Review: Calling Conventions

- call a routine (i.e. transfer control to procedure)
- pass arguments
  - fixed length, variable length, recursively
- return to the caller
  - Putting results in a place where caller can find them
- Manage register

## Today

- More on Calling Conventions
- globals vs local accessible data
- callee vs caller saved registers
- Calling Convention examples and debugging

# Goals for Today

## Review: Calling Conventions

- call a routine (i.e. transfer control to procedure)
- pass arguments
  - fixed length, variable length, recursively
- return to the caller
  - Putting results in a place where caller can find them
- Manage register

## Today

- More on Calling Conventions
- globals vs local accessible data
- callee vs caller saved registers
- Calling Convention examples and debugging

Warning: There is no one true MIPS calling convention.

r14	\$t6		r30	\$fp	frame pointer
r15	\$t7	r31	\$ra	return address	

# Recap: Conventions so far

- first four arg words passed in \$a0, \$a1, \$a2, \$a3
- remaining arg words passed in parent's stack frame
- return value (if any) in \$v0, \$v1
- stack frame at \$sp
  - contains \$ra (clobbered on JAL to sub-functions)
  - contains \$fp
  - contains local vars (possibly clobbered by sub-functions)
  - contains extra arguments to sub-functions (i.e. argument "spilling")
  - contains space for first 4 arguments to sub-functions
- callee save regs are preserved
- caller save regs are not preserved
- Global data accessed via \$gp

# Globals and Locals

Global variables in data segment

- Exist for all time, accessible to all routines

Dynamic variables in heap segment

- Exist between malloc() and free()

Local variables in stack frame

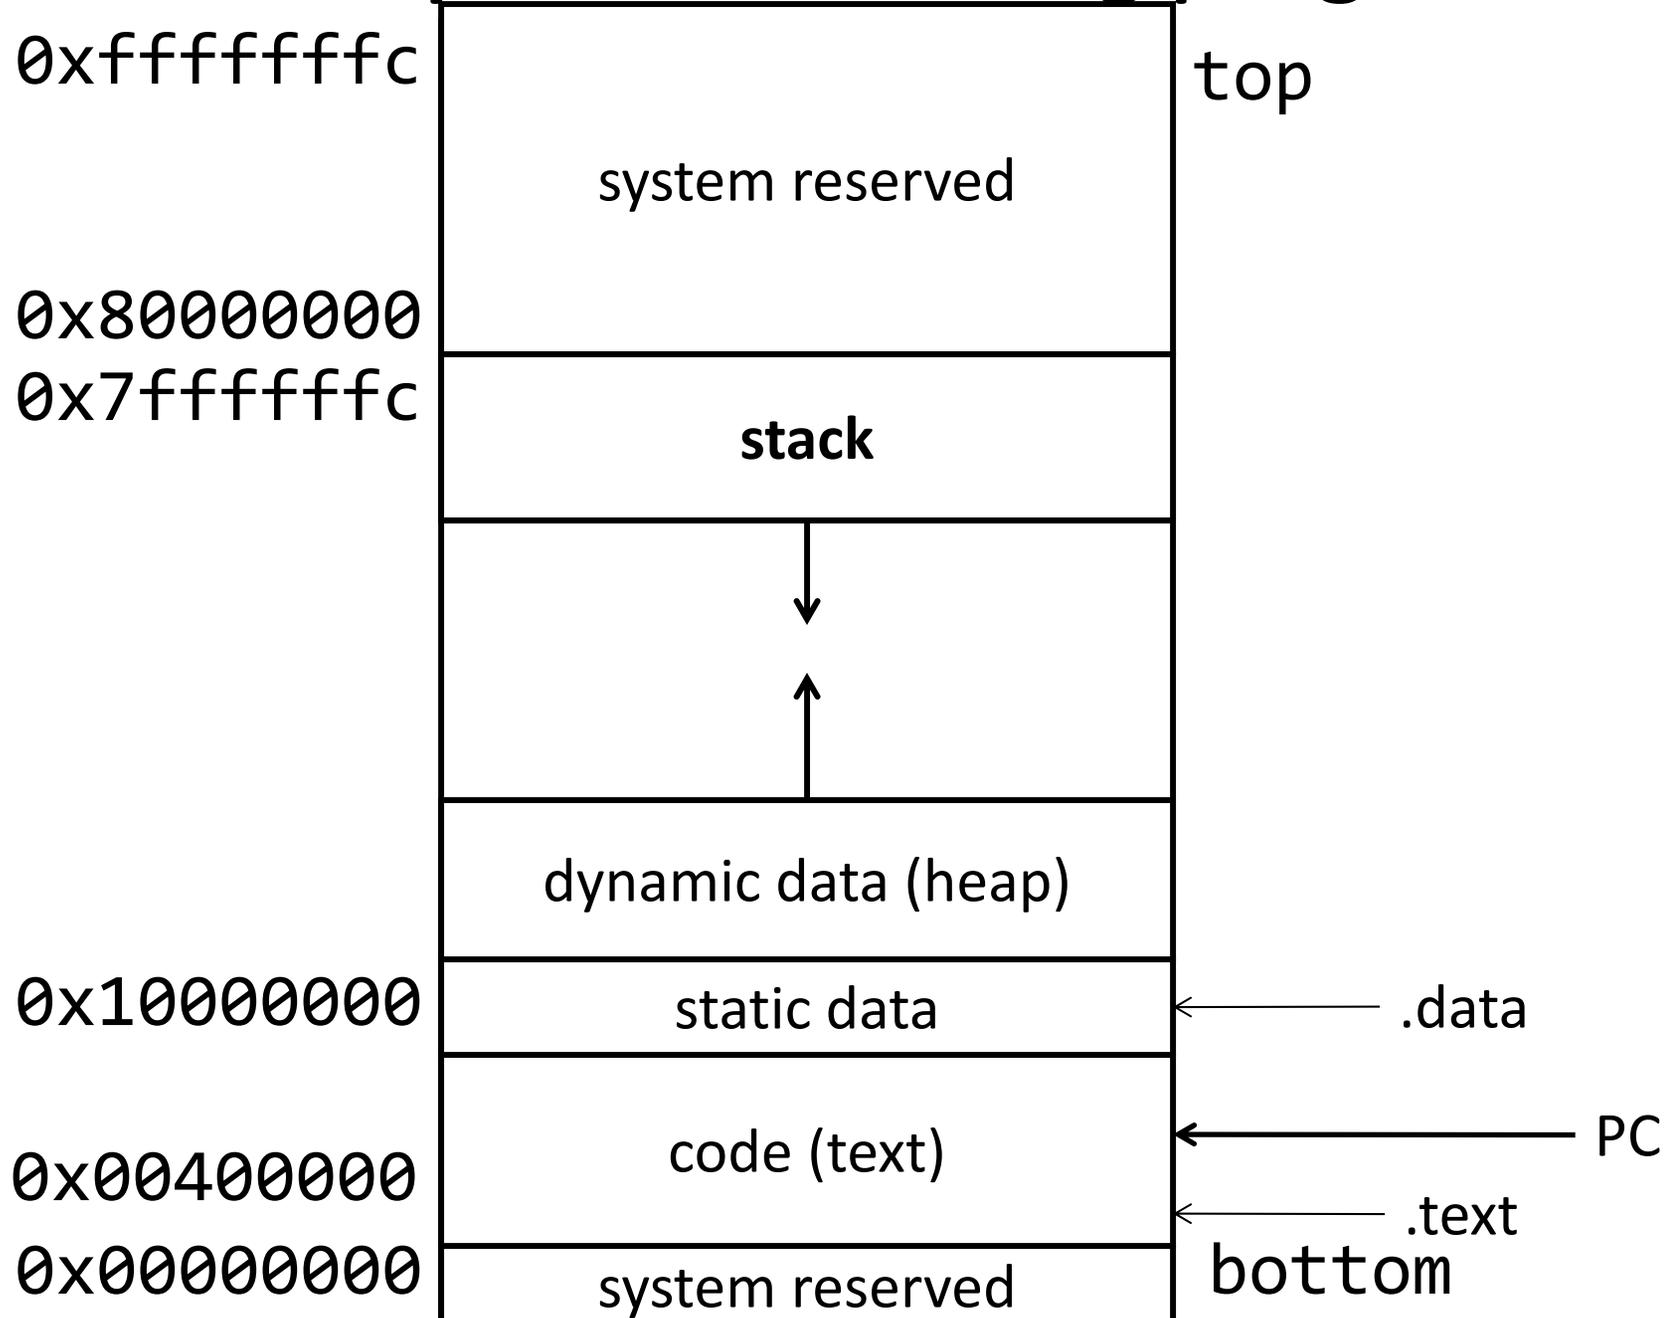

- Exist solely for the duration of the stack frame

Dangling pointers into freed heap mem are bad

Dangling pointers into old stack frames are bad

- C lets you create these, Java does not
- E.g. `int *foo() { int a; return &a; }`

# Anatomy of an executing program

# MIPS Register Recap

Return address: \$31 (ra)

Stack pointer: \$29 (sp)

Frame pointer: \$30 (fp)

First four arguments: \$4-\$7 (a0-a3)

Return result: \$2-\$3 (v0-v1)

Callee-save free regs: \$16-\$23 (s0-s7)

Caller-save free regs: \$8-\$15, \$24, \$25 (t0-t9)

Reserved: \$26, \$27

Global pointer: \$28 (gp)

Assembler temporary: \$1 (at)

# Caller-saved vs. Callee-saved

## Callee-save register:

- Assumes register not changed across procedure call
- Thus, callee must save the previous contents of the register on procedure entry, restore just before procedure return
- E.g. \$ra, \$fp, \$s0-s7

## Caller-save register:

- Assumes that a caller can clobber contents of register
- Thus, caller must save the previous contents of the register before proc call
- Caller, then, restores after the call to subroutine returns
- E.g. \$a0-a3, \$v0-\$v1, \$t0-\$t9

MIPS calling convention supports both

# Caller-saved vs. Callee-saved

## Callee-save register:

- Assumes register not changed across procedure call
- Thus, callee must save the previous contents of the register on procedure entry, restore just before procedure return
- E.g. \$ra, \$fp, \$s0-s7, \$gp
- Also, \$sp

## Caller-save register:

- Assumes that a caller can clobber contents of register
- Thus, caller must save the previous contents of the register before proc call
- Caller, then, restores after the call to subroutine returns
- E.g. \$a0-a3, \$v0-\$v1, \$t0-\$t9

MIPS calling convention supports both

# Caller-saved vs. Callee-saved

Caller-save: If necessary... (\$t0 .. \$t9)

- save before calling anything; restore after it returns

Callee-save: Always... (\$s0 .. \$s7)

- save before modifying; restore before returning

Caller-save registers are responsibility of the caller

- Caller-save register values saved only if used after call/return
- The callee function can use caller-saved registers

Save if want to use **after** a call

Callee-save register are the responsibility of the callee

- Values must be saved by callee before they can be used
- Caller can assume that these registers will be restored

Save **before** use

# Caller-saved vs. Callee-saved

Caller-save: If necessary... (\$t0 .. \$t9)

- save before calling anything; restore after it returns

Callee-save: Always... (\$s0 .. \$s7)

- save before modifying; restore before returning

MIPS (\$t0-\$t9), x86 (eax, ecx, and edx) are caller-save...

- ... a function can freely modify these registers
- ... but must assume that their contents have been destroyed if it in turns calls a function.

MIPS (\$s0 - \$s7), x86 (ebx, esi, edi, ebp, esp) are callee-save

- A function may call another function and know that the callee-save registers have not been modified
- However, if it modifies these registers itself, it must restore them to their original values before returning.

# Caller-saved vs. Callee-saved

Caller-save: If necessary... (\$t0 .. \$t9)

- save before calling anything; restore after it returns

Callee-save: Always... (\$s0 .. \$s7)

- save before modifying; restore before returning

A caller-save register must be saved and restored around any call to a subroutine.

In contrast, for a callee-save register, a caller does not need to do any extra work at a call site (b/c the callee saves and restores the register if it is used).

# Caller-saved vs. Callee-saved

Caller-save: If necessary... (\$t0 .. \$t9)

- save before calling anything; restore after it returns

Callee-save: Always... (\$s0 .. \$s7)

- save before modifying; restore before returning

**CALLER SAVED:** MIPS calls these temporary registers, \$t0-t9

- the calling routine saves the registers that it does not want a called procedure to overwrite
- register values are NOT preserved across procedure calls

**CALLEE SAVED:** MIPS calls these saved registers, \$s0-s8

- register values are preserved across procedure calls
- the called procedure saves register values in its Activation Record (AR), uses the registers for local variables, restores register values before it returns.

# Caller-saved vs. Callee-saved

Caller-save: If necessary... (\$t0 .. \$t9)

- save before calling anything; restore after it returns

Callee-save: Always... (\$s0 .. \$s7)

- save before modifying; restore before returning

Registers \$t0-\$t9 are caller-saved registers

- ... that are used to hold temporary quantities
- ... that need not be preserved across calls

Registers \$s0-s8 are callee-saved registers

- ... that hold long-lived values
- ... that should be preserved across calls

# Callee-Save

- callee save regs are preserved
- caller save regs are not
- Global data accessed via \$gp

# Frame Layout on Stack

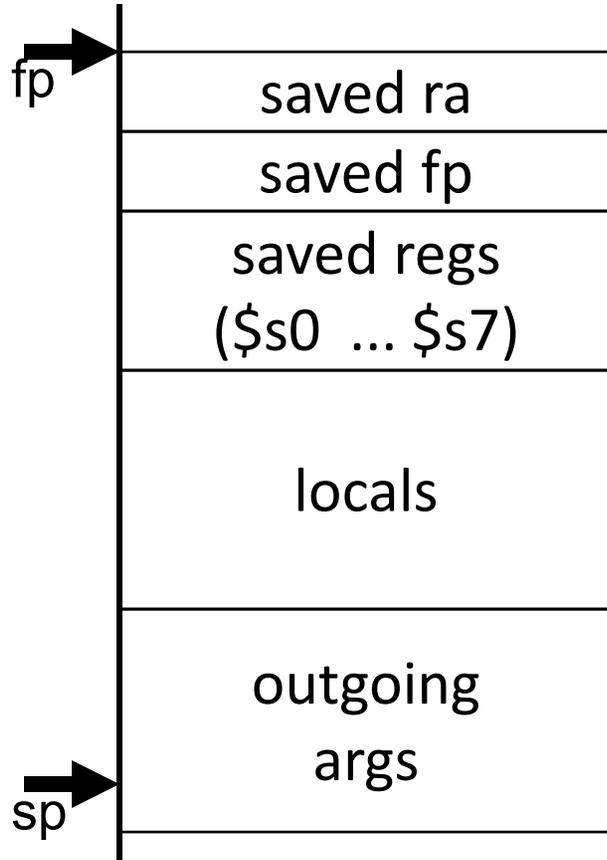

Assume a function uses two callee-save registers.

How do we allocate a stack frame?  
How large is the stack frame?

What should be stored in the stack frame?

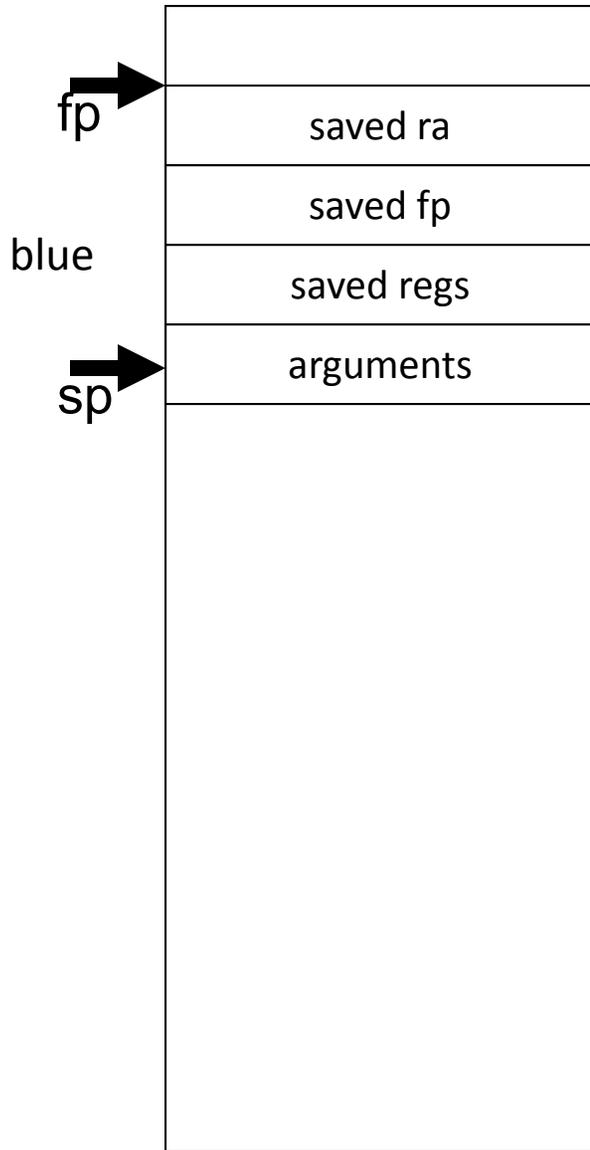

Where should everything be stored?

# Frame Layout on Stack

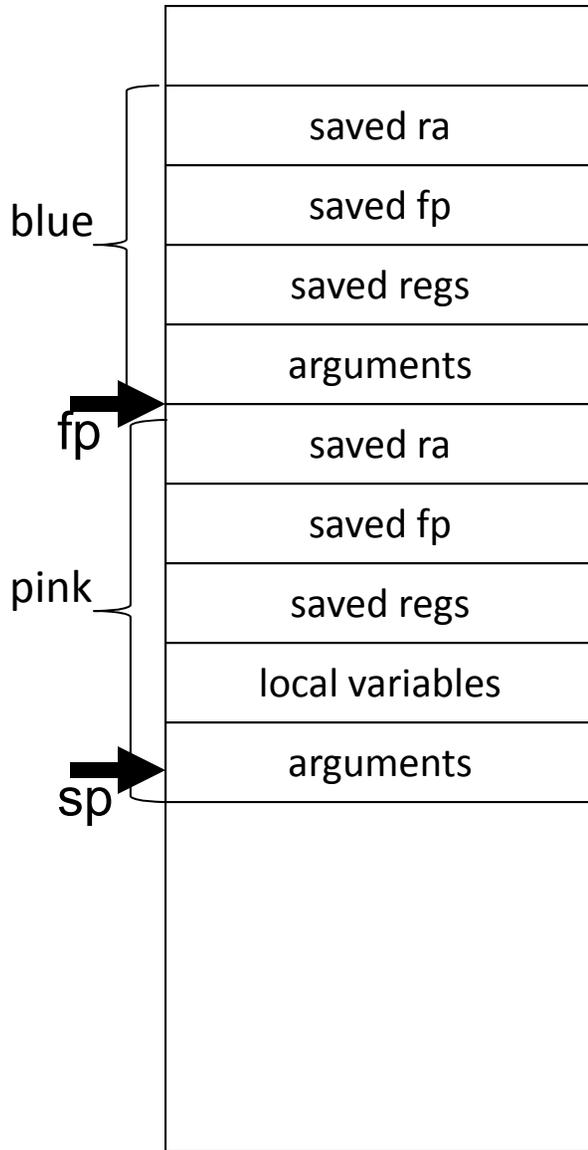

```
ADDIU $sp, $sp, -32 # allocate frame
SW $ra, 28($sp) # save $ra
SW $fp, 24($sp) # save old $fp
SW $s1, 20($sp) # save ...
SW $s0, 16($sp) # save ...
ADDIU $fp, $sp, 28 # set new frame ptr
...
BODY
...
LW $s0, 16($sp) # restore ...
LW $s1, 20($sp) # restore ...

ADDIU $sp, $sp, 32 # dealloc frame
JR $ra
```

# Frame Layout on Stack

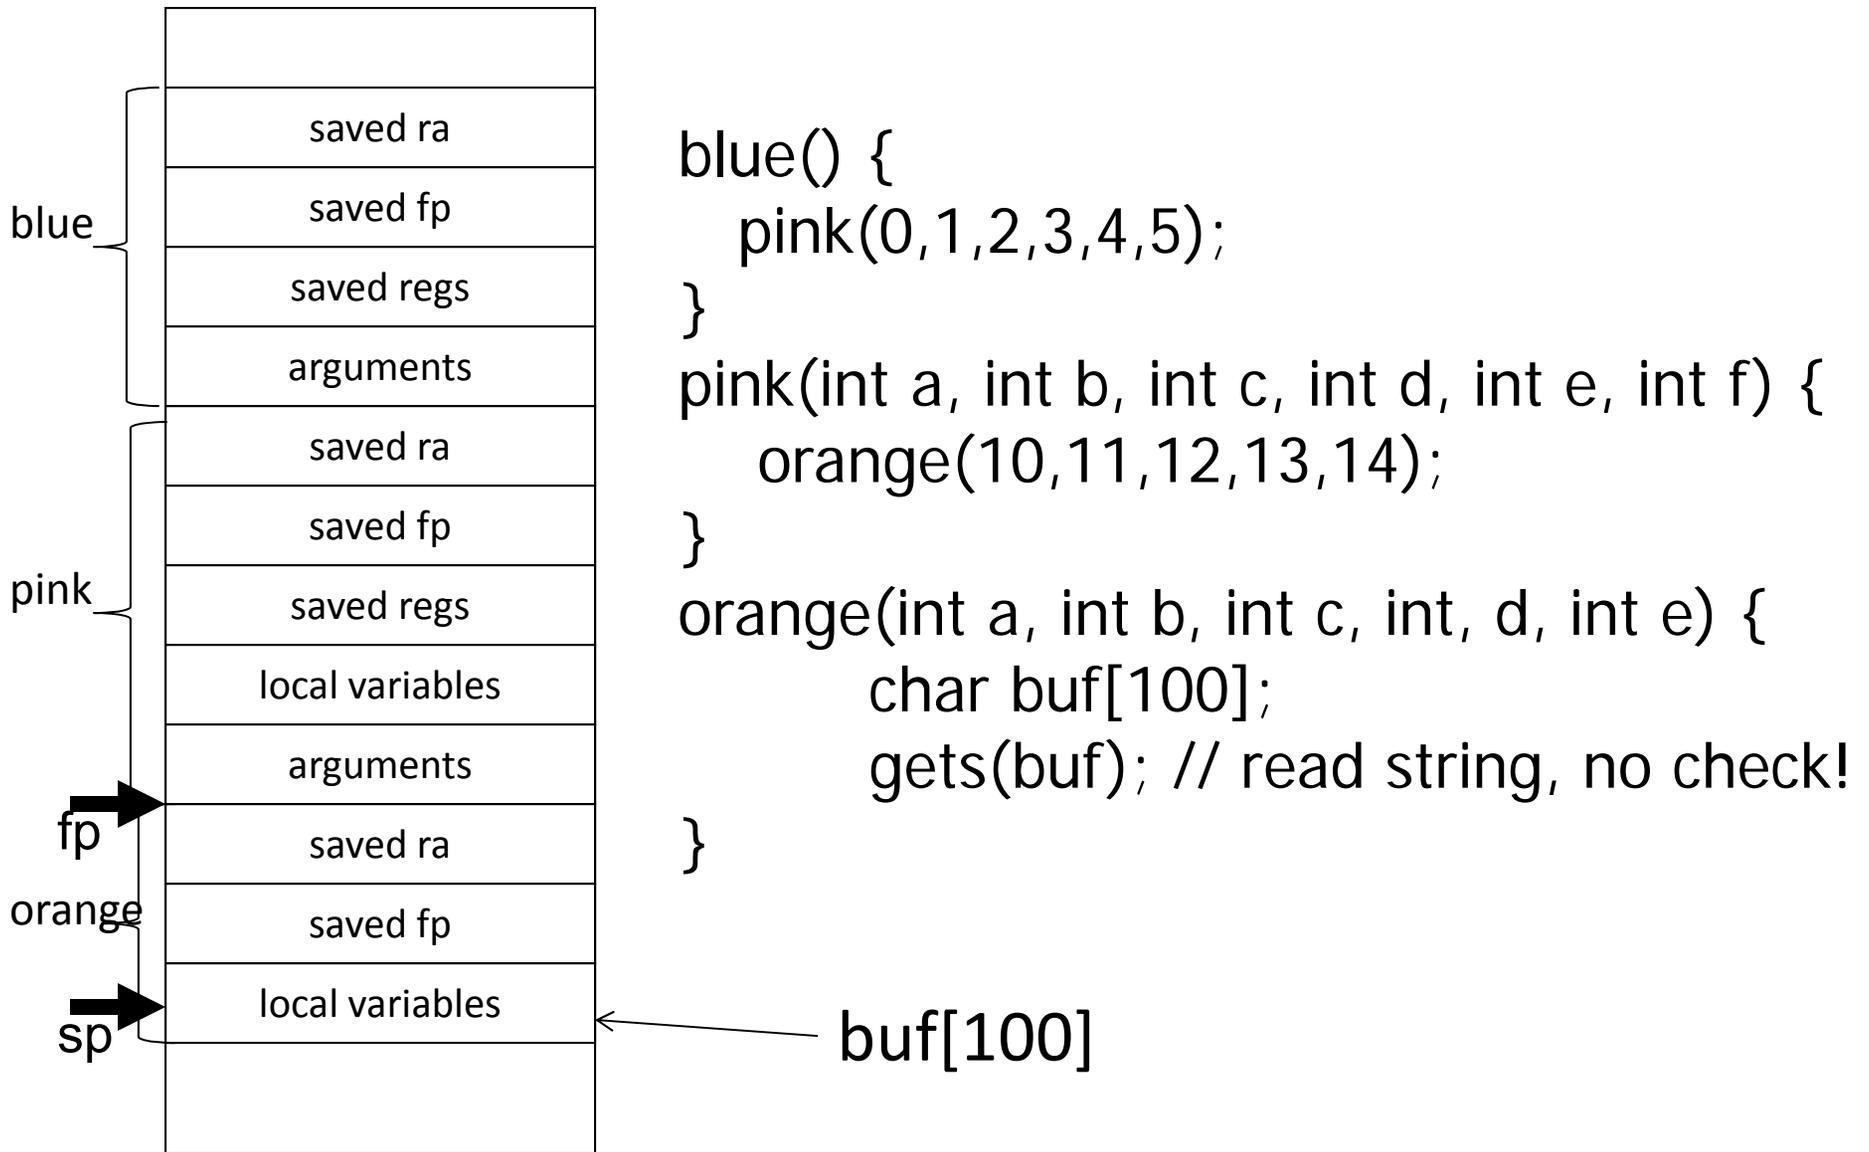

```
blue() {  
    pink(0,1,2,3,4,5);  
}
```

# Frame Layout on Stack

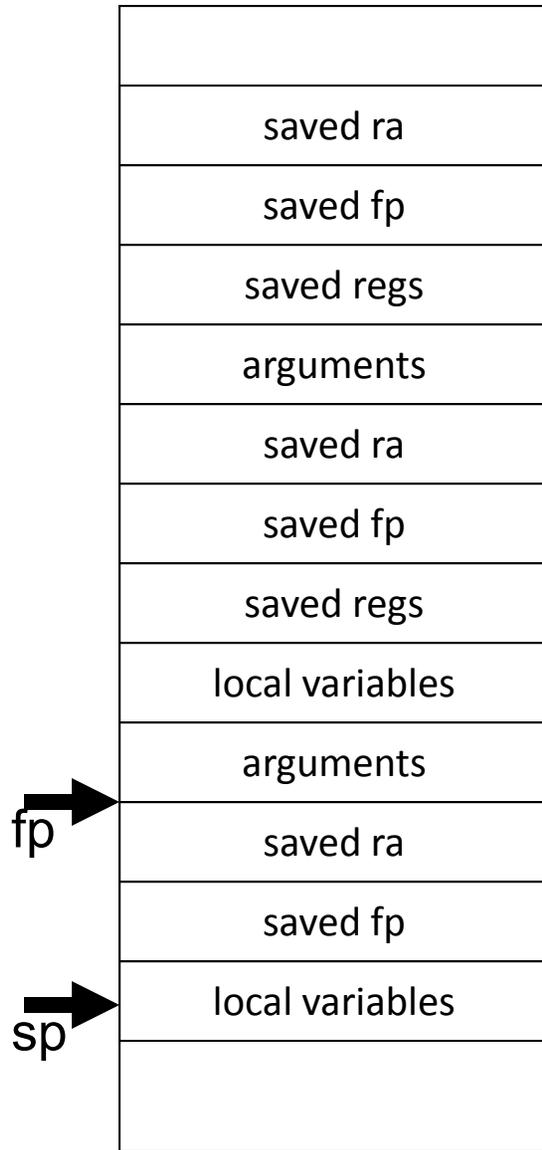

```
blue() {  
    pink(0,1,2,3,4,5);  
}  
pink(int a, int b, int c, int d, int e, int f) {  
    orange(10,11,12,13,14);  
}
```

# Frame Layout on Stack

# Buffer Overflow

```
blue() {  
    pink(0,1,2,3,4,5);  
}  
pink(int a, int b, int c, int d, int e, int f) {  
    orange(10,11,12,13,14);  
}  
orange(int a, int b, int c, int, d, int e) {  
    char buf[100];  
    gets(buf); // read string, no check!  
}
```

buf[100]

What happens if more than 100 bytes is written to buf?

# Activity #1: Calling Convention Example

```
int test(int a, int b) {  
    int tmp = (a&b)+(a|b);  
    int s = sum(tmp,1,2,3,4,5);  
    int u = sum(s,tmp,b,a,b,a);  
    return u + a + b;  
}
```

# Activity #1: Calling Convention Example

```
int test(int a, int b) {  
    int tmp = (a&b)+(a|b);  
    int s = sum(tmp,1,2,3,4,5);  
    int u = sum(s,tmp,b,a,b,a);  
    return u + a + b;  
}
```

test:

Prologue

# Activity #4: Debugging

```

init():          0x400000
printf(s, ...): 0x4002B4
vnorm(a,b):     0x40107C
main(a,b):      0x4010A0
pi:             0x10000000
str1:           0x10000004
    
```

What func is running? printf

Who called it? vnorm

Has it called anything? no

Will it? no b/c no space for outgoing args

Args? Str1 and 0x15

Stack depth? 4

Call trace? printf, vnorm, main, init

# Recap

- How to write and Debug a MIPS program using calling convention
- first four arg words passed in \$a0, \$a1, \$a2, \$a3
- remaining arg words passed in parent's stack frame
- return value (if any) in \$v0, \$v1
- stack frame at \$sp
  - contains \$ra (clobbered on JAL to sub-functions)
  - contains \$fp
  - contains local vars (possibly clobbered by sub-functions)
  - contains extra arguments to sub-functions (i.e. argument "spilling")
  - contains space for first 4 arguments to sub-functions
- callee save regs are preserved
- caller save regs are not
- Global data accessed via \$gp
