## Solving Continuous MDPs: The Linear Quadratic Regulator (LQR)

## Sanjiban Choudhury

## Model-based Planning

Step 0: Build a robot
Step 1: Collect data of your robot doing stuff in the world

Step 2: Use data to learn a dynamics model for your robot

Step 3: Plan with the model to compute an optimal policy

## Today's Challenge!

Step 0: Build a robot
Step 1: Collect data of your robot doing stuff in the world

Step 2: Use data to learn a dynamics model for your robot
Step 3: Plan with the model to compute an optimal policy
How do we do this for robots with continuous state-actions?

## Brainstorm

How do we model the Atlas backflip as a Markov Decision Problem $<\mathrm{S}, \mathrm{A}, \mathrm{C}, \mathrm{T}>$ ?

## The Inverted Pendulum: A

 fundamental dynamics model
## Humanoid balancing

## Rocket landing

## Recall: How do we solve a MDP?

## Value Iteration

Initialize value function at last time-step

$$
V^{*}(s, T-1)=\min c(s, a)
$$

$$
a
$$

for $t=T-2, \ldots, 0$

| $\bigcirc$ | 14 | 14 | 13 | 14 | 14 | 14 | 14 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\rightarrow$ | 14 | 13 | 12 | 14 | 14 | 14 | 14 | 3 | 2 | 1 |
| $N$ | 13 | 12 | 11 | 14 | 14 | 14 | 14 | 4 | 3 | 2 |

|  | 1 | 1 | 2 | 3 | 4 | 5 | $\frac{1}{6}$ | 7 | 8 | 9 |

Compute value function at time-step t

$$
V^{*}(s, t)=\min _{a}\left[c(s, a)+\gamma \sum_{s^{\prime}} \mathscr{T}\left(s^{\prime} \mid s, a\right) V^{*}\left(s^{\prime}, t+1\right)\right]
$$

## Can we apply value iteration to solve this MDP?

$V^{*}(s, t)=\min _{a}\left[c(s, a)+\gamma \sum_{s^{\prime}} \mathscr{T}\left(s^{\prime} \mid s, a\right) V^{*}\left(s^{\prime}, t+1\right)\right]$

## THE CURSE OF DIMENSIONALITY

1D: $\mathbf{1 0}^{1}$

\section*{|  |  |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |}

## Curse of Dimensionality

We cannot discretize continuous states and actions, because the number of states/action grows exponentially with dimension

We need some approximation or assumptions!

## Can we analytically represent and update $V^{*}(s, t) ?$

$$
V^{*}(s, t)=\min _{a}\left[c(s, a)+\gamma \sum_{s^{\prime}} \mathscr{T}\left(s^{\prime} \mid s, a\right) V^{*}\left(s^{\prime}, t+1\right)\right]
$$

What class of functions can we use for $\mathscr{T}\left(s^{\prime} \mid s, a\right)$ and $V^{*}\left(s^{\prime}, t+1\right)$ ?

Can we analytically represent and update

$$
V^{*}(s, t) ?
$$

## Yes*

$V^{*}(s, t)=\min _{a} \underset{\text { (Quadratic) }}{\left[c(s, a)+\gamma \sum_{s^{\prime}} \mathscr{T}\left(s^{\prime} \mid s, a\right) V^{*}\left(s^{\prime}, t+1\right)\right]}$ (Linear) $\quad$ (Quadratratic) $)$

## Linear Quadratic Regulator (LQR)

# LQR is widely used in real world robotics 

But the real world is not linear and quadratic, right?

No, but we can linearize dynamics and quadricize the costs about some reference

LQR can then be used as a very fast subroutine to compute optimal policy

## LQR is widely used in real world robotics

Whole-Arm Manipulation
Target Position: 0.2 m forward

Dynamics of an Inverted Pendulum

## Let's formalize!

## It's quadratics all the way down!

## The LQR Algorithm

Initialize $V_{T}=Q$
For $\mathrm{t}=\mathrm{T}-1, \ldots, 1$

Compute gain matrix

$$
K_{t}=\left(R+B^{T} V_{t+1} B\right)^{-1} B^{T} V_{t+1} A
$$

Update value
$V_{t}=Q+K_{t}^{T} R K_{t}+\left(A+B K_{t}\right)^{T} V_{t+1}\left(A+B K_{t}\right)$

## Value Iteration for Inverted Pendulum

## An Easy Starting Point

## Another Easy Starting Point

## A Hard Starting Point

## Another Hard Starting Point

## tl;dr

THE CURSE OF DIMENSIONALITY

It's quadratics all the way down!
The LQR Algorithm
Initialize $V_{T}=Q$
For $\mathrm{t}=\mathrm{T} . . .1$
Compute gain matrix
$K_{t}=\left(R+B^{T} V_{t+1} B\right)^{-1} B^{T} V_{t+1} A$

Update value
$V_{t}=Q+K_{t}^{T} R K_{t}+\left(A+B K_{t}\right)^{T} V_{t+1}\left(A+B K_{t}\right)$
