

CS 4758/6758: Robot Learning

Spring 2010: Lecture 5

Ashutosh Saxena

Sensors on a Human

Sight: image from a camera

Sound: microphone on a robot

Touch

Taste/Smell

Inertial?

Range sensor?

Sensors and Algorithms

- *Choice of sensors* is as much important as *choice of algorithms*.
- Often people forget about one of them.

Cameras

Several Types of Cameras

- Usual digital cameras
- Pan-Tilt-Zoom

Sensors

Inertial sensors

Gyros, accelerometers, compass.

Sensors

- Ranging sensors
 - Ultrasonic, laser rangefinder (time of flight)
 - Structured light, stereo (triangulation)
 - Infra-red (reflective intensity)

Laser Range Finders

Sensors

- Touch / Haptic sensors
 - Motor Torques
 - Capacitive / resistive touch (think iPhone)
 - Optical

Sensors

- Localization
 - GPS
 - Indoor GPS (Vikon)
 - RFID

Sensor: Statistical Modeling

Additive error:

$$y = x + \text{error}$$

Multiplicative error;

$$y = x * \text{error}$$

Other types of errors?

Additive Errors

- Characterizing the error of the sensor
 - Helps us in combining data from different sensors.
- Represent error as a random variable.
 - Interested in modeling $P(\text{error})$ as statistical distributions.

Statistical modeling

P(error) for Sensor 1

P(error) for Sensor 2

Which sensor is better?

Modeling the measurement

$$y = x + \text{error}$$

error ($= y-x$) is modeled with a statistical distribution.

$P(y|x)$ notation saying we model the observation y given the real value x .
