# **CS5670: Computer Vision**

### Binocular Stereo

### What is this?

Single image stereogram, <a href="https://en.wikipedia.org/wiki/Autostereogram">https://en.wikipedia.org/wiki/Autostereogram</a>

### **Announcements**

 Project 3 due tomorrow, Friday, March 18 at 8pm (code), Monday, March 21 at 8pm (artifact)

- Project 4 (Stereo) to be released on Tuesday, March 22, due Friday, April 1, by 8pm
  - To be done in groups of two

# Stereo Vision as Localizing Points in 3D

- An object point will project to some point in our image
- That image point corresponds to a ray in the world
- Two rays intersect at a single point, so if we want to localize points in 3D we need 2 eyes

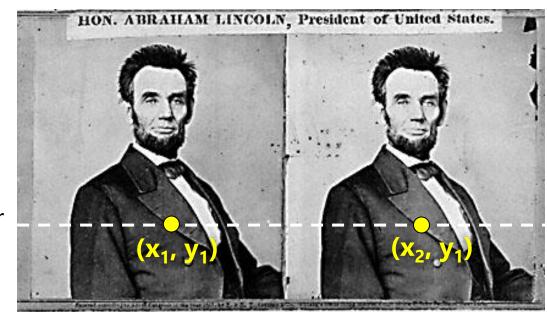

### **Stereo**

- Given two images from different viewpoints
  - How can we compute the depth of each point in the image?
  - Based on how much each pixel moves between the two images

# **Epipolar geometry**

epipolar lines

Two images captured by a purely horizontal translating camera (rectified stereo pair)

 $x_2 - x_1 =$ the *disparity* of pixel  $(x_1, y_1)$ 

## **Disparity = inverse depth**

http://stereo.nypl.org/view/41729

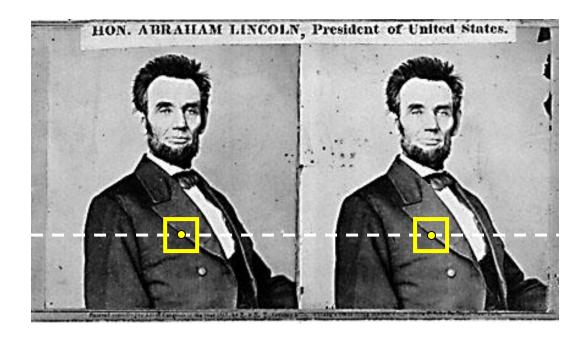

(Or, hold a finger in front of your face and wink each eye in succession.)

# Your basic stereo matching algorithm

### Match Pixels in Conjugate Epipolar Lines

- Assume brightness constancy
- This is a challenging problem
- Hundreds of approaches
  - A good survey and evaluation: <a href="http://www.middlebury.edu/stereo/">http://www.middlebury.edu/stereo/</a>

# Your basic stereo matching algorithm

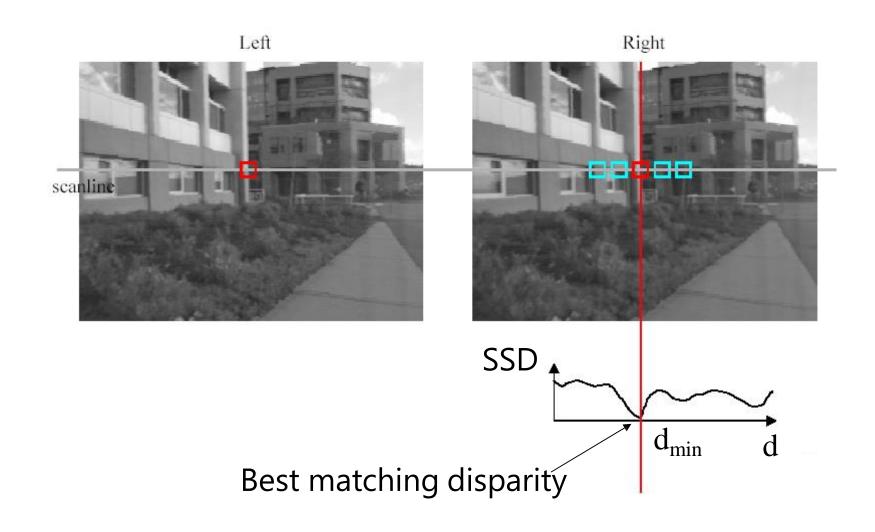

For each epipolar line

For each pixel in the left image

- compare with every pixel on same epipolar line in right image
- pick pixel with minimum match cost

Improvement: match windows

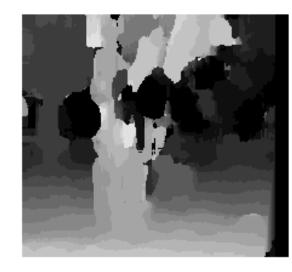

### Stereo matching based on SSD

### Window size

W = 3

W = 20

### Effect of window size

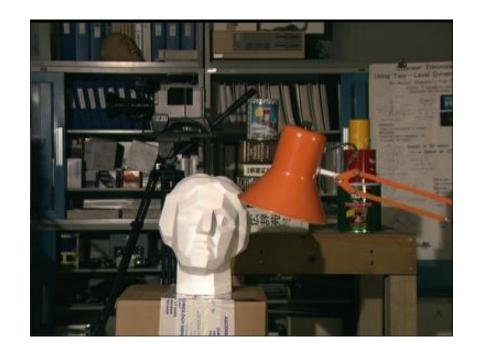

- Smaller window
  - + more detail
  - more noise
- Larger window
  - + less noise
  - less detail

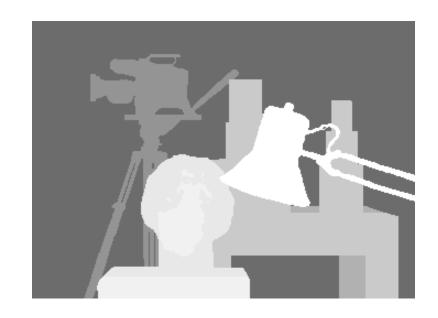

### Better results with adaptive window

- T. Kanade and M. Okutomi, <u>A Stereo Matching Algorithm with an Adaptive Window: Theory and Experiment</u>, ICRA 1991.
- D. Scharstein and R. Szeliski. <u>Stereo matching with nonlinear diffusion</u>. IJCV, July 1998

### **Stereo results**

- Data from University of Tsukuba
- Similar results on other images without ground truth

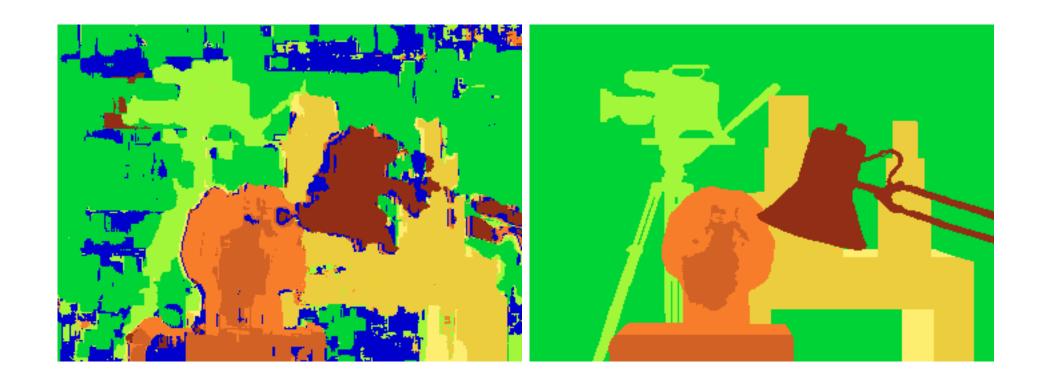

Scene

Ground truth

### Results with window search

Window-based matching (best window size)

Ground truth

### Better methods exist...

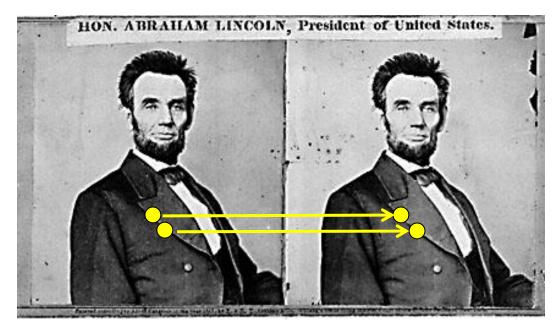

Graph cuts-based method

Ground truth

Boykov et al., <u>Fast Approximate Energy Minimization via Graph Cuts</u>, International Conference on Computer Vision 1999.

For the latest and greatest: <a href="http://www.middlebury.edu/stereo/">http://www.middlebury.edu/stereo/</a>

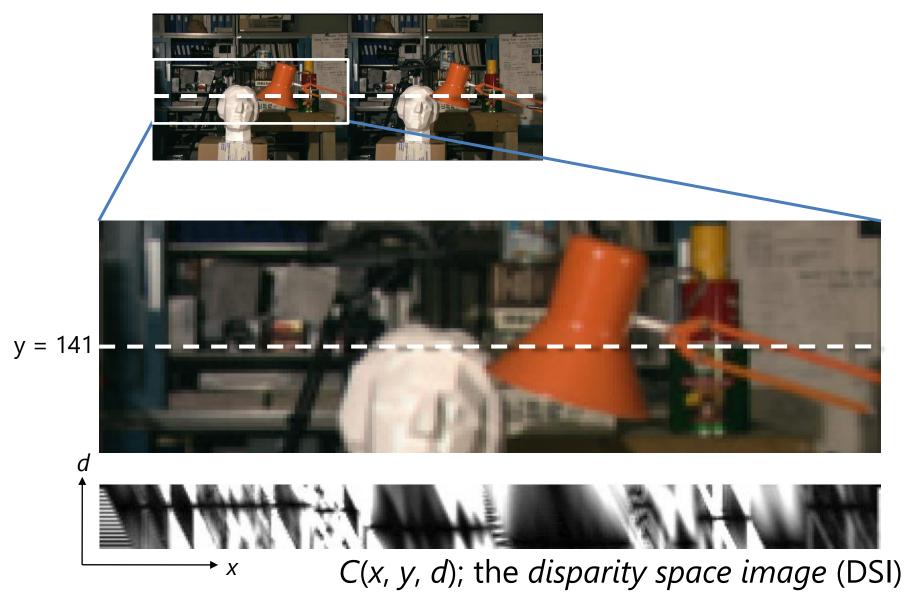

- What defines a good stereo correspondence?
  - 1. Match quality
    - Want each pixel to find a good match in the other image
  - 2. Smoothness
    - If two pixels are adjacent, they should (usually) move about the same amount

• Find disparity map  $\emph{d}$  that minimizes an  $\emph{energy}$   $\emph{function } E(\emph{d})$ 

Simple pixel / window matching

$$E(d) = \sum_{(x,y)\in I} C(x,y,d(x,y))$$

$$C(x, y, d(x, y)) = \frac{\text{SSD distance between windows}}{I(x, y) \text{ and } J(x + d(x, y), y)}$$

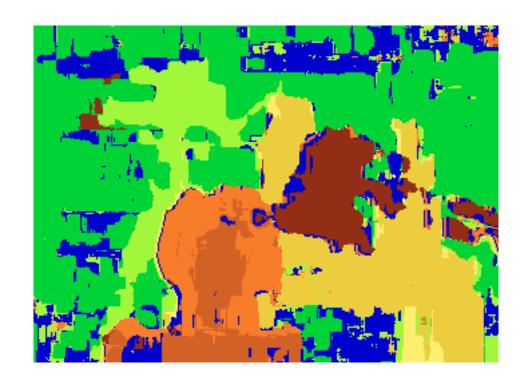

Simple pixel / window matching: choose the minimum of each column in the DSI independently:

$$d(x,y) = \underset{d'}{\operatorname{arg\,min}} C(x,y,d')$$

# **Greedy selection of best match**

Better objective function

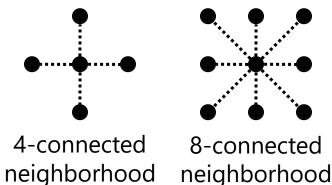

$$E(d) = E_d(d) + \lambda E_s(d)$$
 match cost smoothness cost smoothness cost Adjacent pixels should (usually) move about the same amount

$$E(d) = E_d(d) + \lambda E_s(d)$$

match cost: 
$$E_d(d) = \sum_{(x,y) \in I} C(x,y,d(x,y))$$

smoothness cost: 
$$E_s(d) = \sum_{(p,q) \in \mathcal{E}} V(d_p,d_q)$$

 $\mathcal E$  : set of neighboring pixels

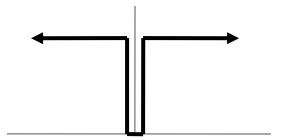

# Smoothness cost $E_s(d) = \sum_{(p,q) \in \mathcal{E}} V(d_p, d_q)$

How do we choose *V*?

$$V(d_p,d_q) = |d_p - d_q|$$
 $L_1 \, \mathrm{distance}$ 

$$V(d_p, d_q) = \begin{cases} 0 & \text{if } d_p = d_q \\ 1 & \text{if } d_p \neq d_q \end{cases}$$

"Potts model"

### **Smoothness cost**

$$E(d) = E_d(d) + \lambda E_s(d)$$

- If  $\lambda$  = infinity, then we only consider smoothness
- Optimal solution is a surface of constant depth/disparity
  - Fronto-parallel surface

 In practice, want to balance data term with smoothness term

## **Dynamic programming**

$$E(d) = E_d(d) + \lambda E_s(d)$$

 Can minimize this independently per scanline using dynamic programming (DP)

### **Dynamic programming**

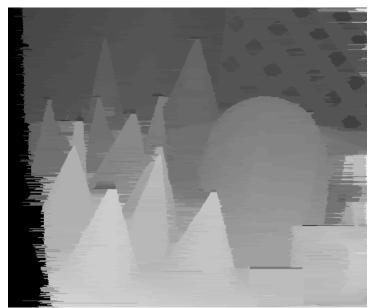

- Finds "smooth", low-cost path through DPI from left to right
- Visiting a node incurs its data cost, switching disparities from one column to the next also incurs a (smoothness) cost

# **Dynamic Programming**

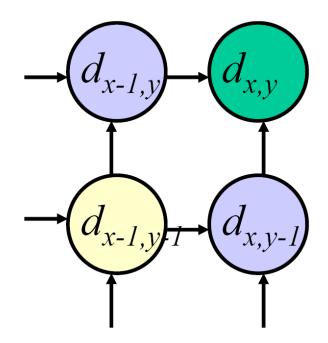

## **Dynamic programming**

Can we apply this trick in 2D as well?

• No: the shortest path trick only works to find a 1D path

### Stereo as a minimization problem

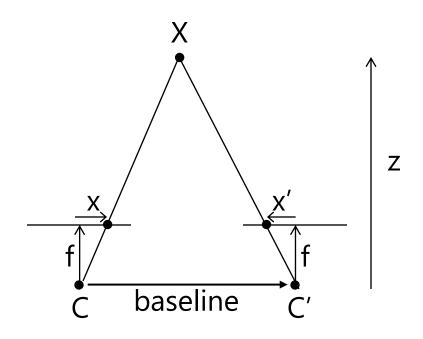

$$E(d) = E_d(d) + \lambda E_s(d)$$

- The 2D problem has many local minima
  - Gradient descent doesn't work well

- And a large search space
  - $-n \times m$  image w/ k disparities has  $k^{nm}$  possible solutions
  - Finding the global minimum is NP-hard in general
- Good approximations exist (e.g., graph cuts algorithms)

# **Questions?**

# **Depth from disparity**

$$disparity = x - x' = \frac{baseline*f}{z}$$

### Real-time stereo

Nomad robot searches for meteorites in Antartica

- Used for robot navigation (and other tasks)
  - Several real-time stereo techniques have been developed (most based on simple discrete search)

### Stereo reconstruction pipeline

- Steps
  - Calibrate cameras
  - Rectify images
  - Compute disparity
  - Estimate depth

#### What will cause errors?

- Camera calibration errors
- Poor image resolution
- Occlusions
- Violations of brightness constancy (specular reflections)
- Large motions
- Low-contrast image regions

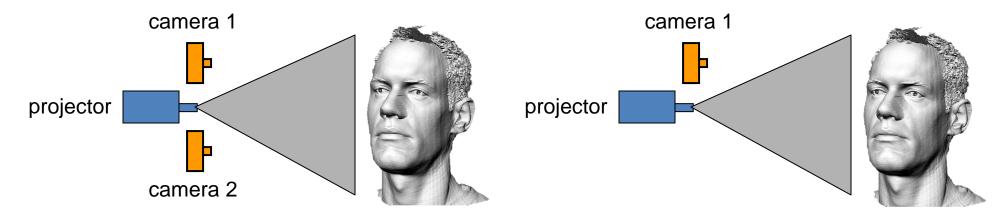

### Active stereo with structured light

Li Zhang's one-shot stereo

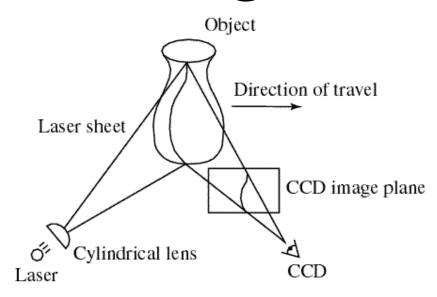

- Project "structured" light patterns onto the object
  - simplifies the correspondence problem
  - basis for active depth sensors, such as Kinect and iPhone X (using IR)

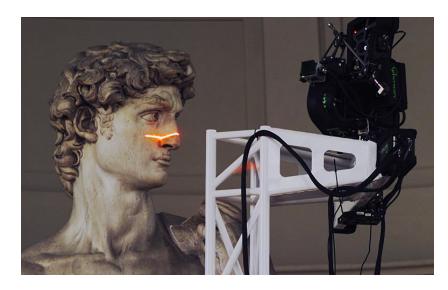

# Active stereo with structured light

## Laser scanning

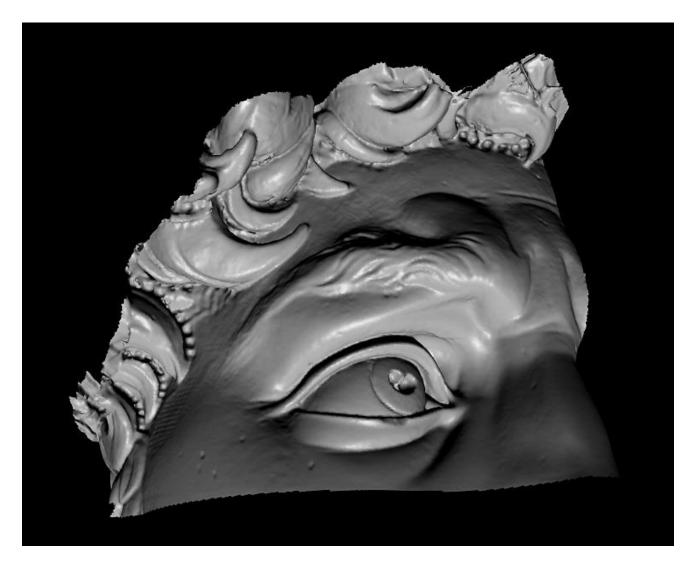

Digital Michelangelo Project <a href="http://graphics.stanford.edu/projects/mich/">http://graphics.stanford.edu/projects/mich/</a>

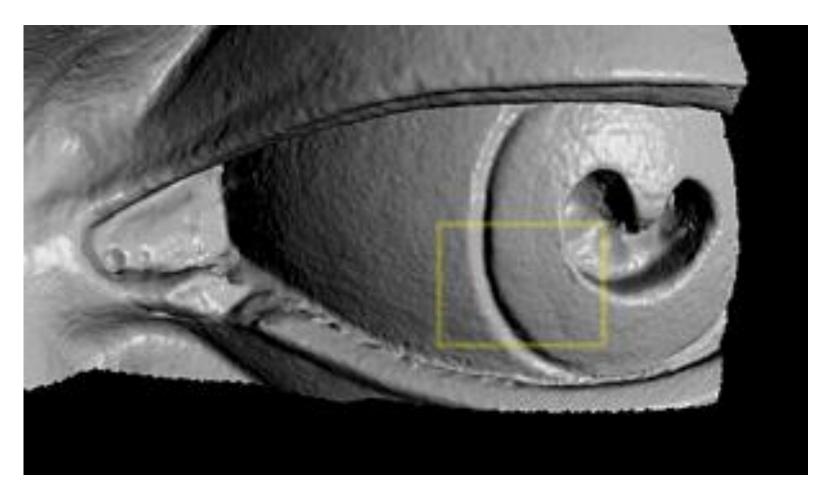

- Optical triangulation
  - Project a single stripe of laser light
  - Scan it across the surface of the object
  - This is a very precise version of structured light scanning
