

- Case (β): $(\lambda x : \sigma. e) v \rightarrow e\{v/x\}$.

The typing derivation of $\Gamma \vdash (\lambda x : \sigma. e) v : \tau$ must look like this:

$$\frac{\frac{\Gamma, x : \sigma \vdash e : \tau}{\Gamma \vdash (\lambda x : \sigma. e) : \sigma \rightarrow \tau} \quad \Gamma \vdash v : \sigma}{\Gamma \vdash (\lambda x : \sigma. e) v : \tau}$$

We want to show that $\Gamma \vdash e\{v/x\} : \tau$ using the facts $\Gamma, x : \sigma \vdash e : \tau$ and $\vdash v : \sigma$. Our induction hypothesis does not help us here; we need to prove this separately. It follows as a special case of the substitution lemma below, which captures the type preservation of β -reduction.

3 The Substitution Lemma

Lemma 4 (Substitution Lemma). $\vdash v : \sigma \Rightarrow (\Gamma, x : \sigma \vdash e : \tau \Leftrightarrow \Gamma \vdash e\{v/x\} : \tau)$.

We will prove this by structural induction on e .

Case 1 $x \notin FV(e)$.

This case covers the base cases $e \in \{n, \text{true}, \text{false}, \text{null}\}$ and $e = y \neq x$ and λ -abstractions $\lambda x : \rho. e$ that bind x . In this case the substitution has no effect and any binding of x in the type environment Γ is irrelevant, thus the lemma reduces to the trivial statement

$$\vdash v : \sigma \Rightarrow (\Gamma \vdash e : \tau \Leftrightarrow \Gamma \vdash e : \tau).$$

Case 2 $e = x$.

In this case the lemma reduces to

$$\vdash v : \sigma \Rightarrow (\Gamma, x : \sigma \vdash x : \tau \Leftrightarrow \Gamma \vdash v : \tau),$$

since $x\{v/x\} = v$. Since v is closed, the type environment Γ is irrelevant, so the statement further reduces to

$$\vdash v : \sigma \Rightarrow (x : \sigma \vdash x : \tau \Leftrightarrow \vdash v : \tau).$$

Since types are unique, both sides of the double implication say that $\sigma = \tau$, so again the lemma reduces to a tautology.

Case 3 $e = e_0 e_1$.

Suppose $\vdash v : \sigma$.

$$\begin{aligned} \Gamma, x : \sigma \vdash e_0 e_1 : \tau &\Leftrightarrow \exists \rho \Gamma, x : \sigma \vdash e_0 : \rho \rightarrow \tau \wedge \Gamma, x : \sigma \vdash e_1 : \rho && \text{typing rule for applications} \\ &\Leftrightarrow \exists \rho \Gamma \vdash e_0\{v/x\} : \rho \rightarrow \tau \wedge \Gamma \vdash e_1\{v/x\} : \rho && \text{induction hypothesis} \\ &\Leftrightarrow \Gamma \vdash (e_0\{v/x\})(e_1\{v/x\}) : \tau && \text{typing rule for applications} \\ &\Leftrightarrow \Gamma \vdash (e_0 e_1)\{v/x\} : \tau && \text{definition of substitution.} \end{aligned}$$

Case 4 $e = \lambda y : \rho. e'$, where $y \neq x$ (the case $y = x$ was covered in Case 1).

Suppose $\vdash v : \sigma$. The type of $\lambda y : \rho. e'$, if it exists, must be $\rho \rightarrow \tau$ for some τ . Similarly, the type of $(\lambda y : \rho. e')\{v/x\} = \lambda y : \rho. (e'\{v/x\})$, if it exists, must be $\rho \rightarrow \tau'$ for some τ' .

$$\begin{aligned}
\Gamma, x : \sigma \vdash (\lambda y : \rho. e') : \rho \rightarrow \tau &\Leftrightarrow \Gamma, x : \sigma, y : \rho \vdash e' : \tau && \text{typing rule for abstractions} \\
&\Leftrightarrow \Gamma, y : \rho, x : \sigma \vdash e' : \tau && \text{exchange} \\
&\Leftrightarrow \Gamma, y : \rho \vdash e'\{v/x\} : \tau && \text{induction hypothesis} \\
&\Leftrightarrow \Gamma \vdash \lambda y : \rho. (e'\{v/x\}) : \rho \rightarrow \tau && \text{typing rule for abstractions} \\
&\Leftrightarrow \Gamma \vdash (\lambda y : \rho. e')\{v/x\} : \rho \rightarrow \tau && \text{definition of substitution.}
\end{aligned}$$

4 Proof of the Progress Lemma

To finish the proof of soundness, it remains to prove the progress lemma. Recall that this lemma states

$$\vdash e : \tau \wedge \text{Irred}(e) \Rightarrow e \in \text{Val},$$

or equivalently,

$$\vdash e : \tau \wedge e \notin \text{Val} \Rightarrow \exists e' e \rightarrow e'.$$

In other words, we cannot get stuck when evaluating a well-typed expression.

We prove the progress lemma using structural induction on e . Recall the definition of a term in λ^{\rightarrow} :

$$e ::= b \mid x \mid \lambda x : \tau. e \mid e_0 e_1,$$

where b denotes a constant. This gives four cases:

Case 1 $e = b$.

Since $b \in \text{Val}$, we are done.

Case 2 $e = x$.

This case is impossible, because we cannot assign a type to x if the type environment is empty.

Case 3 $e = \lambda x : \sigma. e'$.

This case requires another lemma:

Lemma 5. *If $\Gamma \vdash e : \tau$ then $FV(e) \subseteq \text{dom } \Gamma$.*

We leave the proof as an exercise. Since $\vdash e : \tau$, it follows that e is closed, therefore is a value.

Case 4 $e = e_0 e_1$.

We cannot have a value of this form, so the statement of the lemma reduces to

$$\vdash (e_0 e_1) : \tau \Rightarrow \exists e' (e_0 e_1) \rightarrow e'.$$

In any type derivation of $\vdash (e_0 e_1) : \tau$, the last step must have the form

$$\frac{\vdash e_0 : \sigma \rightarrow \tau \quad \vdash e_1 : \sigma}{\vdash (e_0 e_1) : \tau}$$

for some type σ . By the induction hypothesis, either $e_0 \in \text{Val}$ or $\exists e'_0 e_0 \rightarrow e'_0$, and either $e_1 \in \text{Val}$ or $\exists e'_1 e_1 \rightarrow e'_1$. This gives three possibilities:

- If e_0 is not a value, then by the induction hypothesis there $\exists e'_0 e_0 \rightarrow e'_0$, therefore

$$\frac{e_0 \rightarrow e'_0}{e_0 e_1 \rightarrow e'_0 e_1},$$

so $e = e_0 e_1$ can be further reduced.

- If e_0 is a value v but e_1 is not a value, then by the induction hypothesis $\exists e'_1 e_1 \rightarrow e'_1$, and we have

$$\frac{e_1 \rightarrow e'_1}{v e_1 \rightarrow v e'_1},$$

so $e = v e_1$ can be further reduced.

- If both e_0 and e_1 are values, then since e_0 is a value with an arrow type $\sigma \rightarrow \tau$, it has to be an abstraction, say $e_0 = \lambda x : \sigma. e'$, and e_1 is some value v of type σ . Then

$$e = (\lambda x : \sigma. e') v \rightarrow e' \{v/x\},$$

so e can be further reduced.

This completes the proof.
