

A Discriminative Model for Tree-to-Tree Translation (*Original*)

Brooke Cowan, Ivona Kucerova, Michael Collins EMNLP 2006

Discriminatory model-to-Tree Translation (via Estonian)
 A model of discrimination for Tree-to-Tree Translation (via French)
 The distinctive pattern of the tree to tree translation (via Lithuanian)
 An insightful model tree to tree Lyrics (via Macedonian)
 For a distinctive tree-for-Tree Translation Model (via Turkish)

Presented by
 Martin McRoy and Ruben Sipos

Motivation / Related Work

Approaches

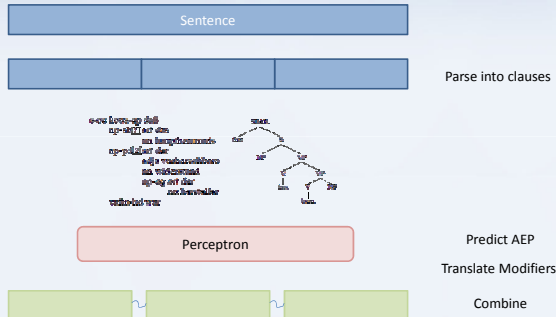

- Statistical machine translation (Google)
- Rule based (Worldingo → Microsoft Windows)
- Example based

(Och and Ney, 2004) Phrase-based approach
 (Alshawi, 1996) (Wu, 1997) Transductive grammars

Goal: Learn a model that maps parse trees in the source language to parse trees in the target language

- Clause by clause
- German vs. English syntax
- General approach can be applied to different set of languages

Process Overview

Sentence

Parse into clauses

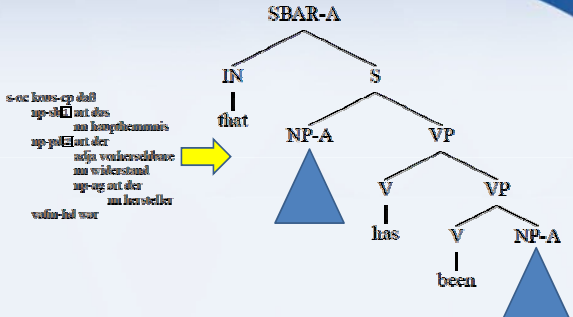

Perceptron

Predict AEP

Translate Modifiers

Combine

Extended projection

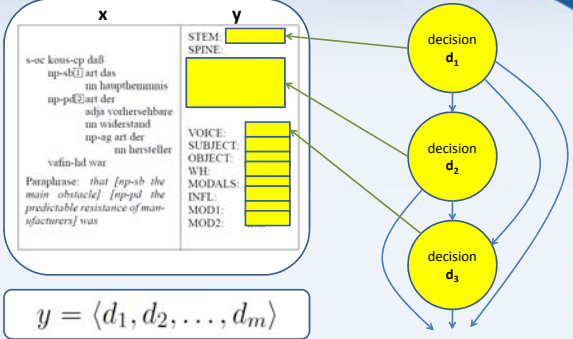

that the main obstacle **has been** the predictable resistance of manufacturers

Aligned extended projection

s-oc kous-cp daß np-sb[1] art das nn hauptthemmis np-pd[2] art der adja vorhersehbar nn widerstand np-ag art der nn hersteller vafin-hd war Paraphrase: that [np-sb the main obstacle] [np-pd the predictable resistance of manufacturers] was	STEM: be SPINE: SBAR-A IN that S NP-A VP V NP-A VOICE: active SUBJECT: [1] OBJECT: [2] WH: NULL MODALS: has INFL: been MOD1: null MOD2: null
---	---

VOICE: One of two alternatives, active or passive, specifying the voice of the main verb.

Model

$y = \langle d_1, d_2, \dots, d_m \rangle$

Decisions

$d_i \in \text{ADVANCE}(x, \langle d_1, \dots, d_{i-1} \rangle)$

$\bar{\phi}(x, \langle d_1, \dots, d_{i-1} \rangle, d_i) \in \mathbb{R}^d$

1	main verb
2	any verb in the clause
30	are all of the verbs at the end?
41	mathematical label of the root of the tree
22	numerical labels of all nodes constituting the subtree

Prediction: Beam search

$\Phi(x, y) = \sum_{i=1}^m \bar{\phi}(x, \langle d_1, \dots, d_{i-1} \rangle, d_i)$

$\text{SCORE}(x, y) = \Phi(x, y) \cdot \bar{\alpha}$

Learning

training pairs: $\langle (e_1, g_1), (e_2, g_2), \dots, (e_n, g_n) \rangle$

scoring: $\Phi(x, y) = \sum_{i=1}^m \bar{\phi}(x, \langle d_1, \dots, d_{i-1} \rangle, d_i)$

$\text{SCORE}(x, y) = \Phi(x, y) \cdot \bar{\alpha}$

perceptron:

Inputs: Training examples (x_i, y_i)

Initialization: Set $\bar{\alpha} = 0$

Algorithm:

For $t = 1 \dots T, i = 1 \dots n$

Calculate $z_i = \arg \max_{z \in \text{GEN}(x_i)} \Phi(x_i, z) \cdot \bar{\alpha}$

If $(z_i \neq y_i)$ then $\bar{\alpha} = \bar{\alpha} + \Phi(x_i, y_i) - \Phi(x_i, z_i)$

Output: Parameters $\bar{\alpha}$

Recap

$\Phi(x, y) = \sum_{i=1}^m \bar{\phi}(x, \langle d_1, \dots, d_{i-1} \rangle, d_i)$

$\text{SCORE}(x, y) = \Phi(x, y) \cdot \bar{\alpha}$

$F(x) = \arg \max_{y \in \text{GEN}(x)} \text{SCORE}(x, y)$

beam search

CRF

$p(Y_v | X, Y_w, w \sim v)$

Results & Conclusions

- per clause based machine translation
- structured prediction of AEPs
- decisions depend on
 - whole input X and
 - all previous decisions
- learning based on perceptron
- beam search to solve *argmax*
- comparable results with other approaches
