

- Previous Lecture:
  - Inheritance—**extending** a class
  - Constructor in the subclass
- Today's Lecture:
  - Overriding methods
  - Using **super** to access members from the superclass
  - What is "polymorphism"?
- Reading:
  - Sec 7.2. Optional: Sec 7.3

April 25, 2006

Lecture 25

2

Make TrickDice a **subclass** of Dice.

<pre>class Dice {     private int top;     private int sides;      public Dice(...) {...}     public void roll() {...}     public String toString() {...}     public int getTop() {...}     public int getSides() {...} }</pre>	<pre>class TrickDice extends Dice {     private int weightedSide;     private int weight;      public TrickDice(...) {...}     public void roll() {...}     public String toString() {...}     public int getWSide() {...}     public int getWeight() {...} }</pre>
---	---

April 25, 2006

Lecture 25

3

```
class TrickDice extends Dice {
    private int weightedSide; //Weighted side appears more often
    private int weight;      //Weighted side appears weight
                             // times as often as other sides

    /** TrickDice has side s appearing with weight w */
    public TrickDice(int numFaces, int s, int w) {
        super(numFaces);
        weightedSide = s;
        weight = w;
    }

    //other methods...
}
```

April 25, 2006

Lecture 25

5

## Reserved word **super**

Invoke constructor of superclass

**super(parameter-list);**

**parameter-list** must match that in superclass' constructor

April 25, 2006

Lecture 25

6

## Calling one constructor from another

- In a subclass' constructor, call the superclass' constructor with the keyword **super** instead of the superclass' (constructor's) name
- Always make a call to the superclass' constructor as the 1<sup>st</sup> statement in a constructor in a subclass!

April 25, 2006

Lecture 25

7

## Calling one constructor from another

- In a subclass' constructor, call the superclass' constructor with the keyword **super** instead of the superclass' (constructor's) name
- To call another constructor from a constructor **in the same class**, use the keyword **this**
- Always make a call to a constructor (**super** or **this**) as the 1<sup>st</sup> statement in a constructor in a subclass!

April 25, 2006

Lecture 25

8

```

/* A 2nd TrickDice constructor: 6-sided
TrickDice has side s appearing with weight w,
s ≤ 6 */
public TrickDice(int s, int w) {
    //what goes in here?
}

```

- TrickDice(6, s, w);
- this(6, s, w);
- Dice(6, s, w);
- super(6, s, w);
- 2 of the above

April 25, 2006

Lecture 25

10

## Which components get inherited?

- public components get inherited
- private components exist in object of child class, but cannot be **directly** accessed in child class ⇒ we say they are **not inherited**
- Note the difference between inheritance and existence!

April 25, 2006

Lecture 25

11

## protected visibility (see Sec 7.2 for detail)

- Visibility modifiers control which members get inherited
- private
  - Not inherited, can be *accessed* by local class only
- public
  - Inherited, can be *accessed* by all classes
- protected
  - Inherited, can be *accessed* by subclasses
- Access: access as though declared locally
- All variables from a superclass *exist* in the subclass, but the **private** ones cannot be *accessed* directly

April 25, 2006

Lecture 25

12

## Overridden methods: which version gets invoked?

To create TrickDice: call the TrickDice constructor, which calls the Dice constructor, which calls the roll method. Which roll method gets invoked?

<pre> class Dice {     public Dice(...) {         ...         roll();     }      public void roll() {...}      //...other methods, fields } </pre>	<pre> class TrickDice extends Dice{     public TrickDice(...) {         super(...);         ...     }      public void roll() {...}      //...other methods, fields } </pre>
--	--

April 25, 2006

Lecture 25

15

## Overriding methods

- Subclass can *override* definition of inherited method
- New method in subclass must have same signature as superclass (but has different method body)
- Which method gets used??  
*The object that is used to invoke a method determines which version is used*
- Method declared to be **final** cannot be overridden
- Do not confuse *overriding* with *overloading*!

April 25, 2006

Lecture 25

16

## Accessing members in superclass

super

- From constructor in subclass, call superclass' constructor
- Access superclass' version of a overridden method. E.g.:

super.toString()

April 25, 2006

Lecture 25

18

## static methods & variables

- Do not re-declare static components!
- Same rules for inheritance (accessibility) with respect to visibility modifiers
- Static method: implicitly **final**
- Static variable: same memory space as superclass

April 25, 2006

Lecture 25

19

## Important ideas in inheritance

- Single inheritance
- Keep common features as high in the hierarchy as reasonably possible
- Use the superclass' features as much as possible
- "Inherited"  $\Rightarrow$  "can be accessed as though declared locally"  
(private variables in superclass *exists* in subclasses; they just cannot be accessed directly)
- Inherited features are continually passed down the line
- Use different hierarchies for different problems

April 25, 2006

Lecture 25

20

## Polymorphism

- "Have many forms"
- A *polymorphic* reference refers to different objects (related through inheritance) at different times

April 25, 2006

Lecture 25

21

## Suppose class Plane extends Vehicle

```
Vehicle mover; //a Vehicle reference
Plane flyer;   //a Plane reference
mover= new Vehicle(...);
flyer= new Plane(...);
// A plane is a vehicle
    mover= new Plane(...);
    mover= flyer;
// A vehicle is not a plane
    flyer= new Vehicle(...); //invalid
```

April 25, 2006

Lecture 25

24

## Another polymorphic example

```
Vehicle[] mover = new Vehicle[5];

mover[0]= new Vehicle(...);
mover[1]= new Plane(...);
mover[2]= new Plane(...);
mover[3]= mover[1];
```

The reference type may not be the same as the object type!

April 25, 2006

Lecture 25

25

```

/** A Dice (or Die) */
class Dice {

    private int top;    // top face
    private int sides;  // number of sides

    /** A Dice has numSides sides and the top face is random */
    public Dice(int numSides) {
        sides= numSides;
        roll();
    }

    /** top gets a random value in 1..sides */
    public void roll() {
        setTop(randInt(1,getSides())) ;
    }

    /** = random int in low..high */
    public static int randInt(int low, int high) {
        return (int) (Math.random()*(high-low+1))+low;
    }

    /** = Get top face */
    public int getTop() { return top; }

    /** = Get number of sides */
    public int getSides() { return sides; }

    /** Set top to faceValue */
    public void setTop(int faceValue) { top= faceValue; }

    /** = String description of this Dice */
    public String toString() {
        return  getSides() + "-sided dice shows face " + getTop();
    }
} //class Dice

```

---

```

/** A TrickDice has one weightedSide such that the
 *  weightedSide appears weight times as often as other sides
 */
class TrickDice extends Dice {

    private int weightedSide; //Weighted side appears more often
    private int weight;      //Weighted side appears weight times as often as other sides

    /** TrickDice has side s appearing with weight w */
    public TrickDice(int numFaces, int s, int w) {
        super(numFaces);
        weightedSide= s;
        weight= w;
    }

    /** = Get weighted side */
    public int getWSide() { return weightedSide; }

    /** = Get weight of weighted side */
    public int getWeight() { return weight; }

    /** top gets random value in 1..sides given trick property */
    public void roll() {
        int r= randInt(1,(getSides()+weight-1));
        if (r>getSides())
            setTop(weightedSide);
        else
            setTop(r);
    }

    /** = String description of this TrickDice */
    public String toString() { return "Tricky " + super.toString(); }
} //class TrickDice

```
