

## Announcements

- Prelim One
- Returned in Section
- Unclaimed in section or no indication of section
- Available for pickup at the ACCEL Green Room during consulting hours starting Ifursday
- Section
- In lab this week.
- Online evaluations of $\mathcal{T A} s$ start this week (see we bsite)
- Project 3
- Due Thursday, Marcf 8
- Posted last Saturday; typo in integral.m was corrected Monday

## Topics

- Reading: CFile 5, Section 5.2
- Recall
- Mat lab vectors (1D arrays)
- Vector indices ("subscripts")
- Creating vectors
- / I, ":" notation, special functions, appending, combining
- Plans for today
- Characters \&strings
- More examples using Matlab vectors
- Ulse of plot()

## Matlab Strings

- We fiave already made use of strings
- $n=$ input(乐ext number: );
- fprintf('The answer is \%d.; answer);
- 'Next number: 'and 'Ifie answer is \%d.'are both strings
- A string is made up of individualcharacters
- The string 'CS $100 \mathcal{M}$ rules'consists of 12 characters ( 8 (etters, 3 digits, and 1 space)
- In Matlab, a string is a vector of cfaracters
- Since a string is a vector, it uses the same indexing scheme as any other vector

## Single Quotes

- Anytfing enclosed in single quotes is a string (even if it looks like sometring else)
- '100'is a string (i.e., a character vector) of length 3
- 100 is a numeric value
- 'pi'is a string of lengtf 2
- pi is predefined constant (=3.14159..)
- ' $x$ 'is a character (also a string of length 1)
- $x$ is a variable name

## Strings as Vectors

Vectors

- Indexing
$v=\left[\begin{array}{lll}7 & 0 & 5\end{array}\right]$;
$x=v(3)$; $\quad \%$ x is 5
$v(1)=1 ; \quad \% \quad v$ is $\left[\begin{array}{lll}1 & 0 & 5\end{array}\right]$
- ":"notation
$v=2: 5 ; \quad \% v$ is [2 344 5]
- Appending
$v=\left[\begin{array}{lll}7 & 0 & 5\end{array}\right]$;
$v(4)=2 ; \quad \% v$ is $\left[\begin{array}{llll}7 & 0 & 5 & 2\end{array}\right]$
- Concatenation
$v=1 v\left[\begin{array}{ll}4 & 6\end{array}\right]$
$\% v$ is 17052461

Strings

- Indexing
$s=$ hello';
$c=s(2) ; \quad \% c$ is ${ }^{\prime}$
$s(1)=$ y' $\quad \%$ s is 'gelfo
- ":" notation
$s=a^{\prime} a^{\prime}: g^{\prime} ; \quad$ \%s is 'abcdefg
- Appending
$s=$ 'duck';
$s(5)=s^{\prime} ; \quad$ \% $s$ is 'ducks ,
- Concatenation
$s=1 s$ 'quack']
\% $s$ is 'ducks quack'

## Some UlsefulString Functions

str $=$ 'CS 100 M rules ${ }^{\prime} ;$

| $\begin{aligned} & \text { isletter(str) } \\ & \text { isspace(str) } \end{aligned}$ | $\begin{aligned} & \%\left[\begin{array}{lllllllllll} 1 & 1 & 0 & 0 & 0 & 1 & 0 & 1 & 1 & 1 & 1 \end{array} 1\right. \\ & \% \end{aligned}\left[\begin{array}{llllllllllllll} 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \end{array}\right]$ |
| :---: | :---: |
| $s=$ lower (str); | \% s is 'cs 100 m rules ${ }^{\text {, }}$ |
| $s=$ upper (str); | \% s is 'CS 100 M RULES ' |
| ischar(str); | \% Is str a char array? 1 (= true) |

isletter(str) $\quad \% 1110001011111$ ] isspace (str) $\quad \%\left[\begin{array}{llllllllll}0 & 0 & 0 & 0 & 100000]\end{array}\right.$
$s=$ lower (str); $\quad \% s$ is cs 100 m rules ,
$s=$ upper(str); $\quad \% s$ is 'CS $100 \mathcal{M}$ RULES ,
ischar(str); $\quad$ Is strachar array? 1 (= true)

Example: Capitalize First Letters

- Goal:
- Write a function to capitalize just the first letter of each word in a string
- Assume the string consists entirely of letters and spaces
- Function fieader
function result $=$ capitalize (str)
\% Post: Convert string so each word has just first letter capitalized
\% Pre: Input string consists entirely of letters \& spaces

Post $=$ What is supposed to have happened when function is done (i.e., whit the function does)
Pre $=$ What assumptions are being made when function starts

## ASCI I

(American Standard Code for Information Interchange) ASCII Code Character ASCIICode Character

| 48 | '0' | 97 | ${ }^{\prime}{ }^{\prime}$ |
| :---: | :---: | :---: | :---: |
| 49 | '1' | 98 | '6' |
| 50 | '2' | 99 | 'c' |
| 51 | 3' | $\ldots$ | $\ldots$ |
| ... | $\cdots$ | 122 | 'z' |
| 65 | 'A' | $\ldots$ | $\ldots$ |
| 66 | $\mathfrak{B}^{\prime}$ | 127 | $\mathcal{D E L}$ |
| 67 | 'C' |  |  |
| $\cdots$ | $\cdots$ |  |  |
| 90 | ' $z^{\prime}$ ' |  |  |

## Characters $\leftrightarrow$ ASCII Code

| str $=$ CS $100 \mathcal{M} ;$ | \% Vector (1D array) of characters |
| :--- | :--- |
| code $=$ double (str); | \% Converts each character to a number; |
|  | \% code is a standard Matlab vector |
| $s=$ char(code); | \% Converts a vector of numbers into |
|  | \% a string (i.e., a vector of characters) |

## Character Aritfmetic

- You can do "matf" witf cfaracters

| 'd'- 'a' | \% Produces 3 |
| :---: | :---: |
| '9, $8^{\prime}$, | \% Produces 1 |
| ' ${ }^{\prime}$ < ${ }^{\prime} d^{\prime}$ ' | \% Produces 1 (= true) |
| ${ }^{\prime}{ }^{\prime}<{ }^{\prime}{ }^{\prime}{ }^{\prime}$ ' | \% Produces 0 ( $=$ false) |
| $z^{\prime}<'^{\prime}$, | \% Produces 1 (=true) |
|  | \% Because 90, the ASCII code for ' $Z$ '; <br> \% is less than 98, the ASCII code for '6 |
| ${ }^{\prime} a^{\prime}+2$ | \% Produces 99 |
| char ('a' 2 ) | \% Produces 'c' |

## Example: to Ulpper

- Goal: Write toUlpper(), our own version of Matlab's upper(), a function to convert a string to all uppercase
- We want to do this without using Matlab's function upper()
- Function feader
functionstr = toUlpper (str)
\% Post: Convert string so alf letters are upper case
\% Pre: Input is a string
- Idea: Note that 'a'-'A'has the same value as
'b' - ' $\mathcal{B}$ 'which fas the same value as 'c'- $\mathcal{C}$ ', etc.
- All we have to do is subtract the right number from a lowercase letter and we ll have the equivalent uppercase letter

## Drawing in Matlab

$x=\left[\begin{array}{lll}0 & 3 & 6\end{array}\right] ;$
$y=\left(\begin{array}{ll}0 & 5\end{array}\right] ;$
plot(x, y, (or);

- This code will plot the points $(0,0),(3,5)$, and $(6,1)$
- 'or'indicates
- UConnect with lines

- 's':Markpoints with circles
- $r$ : Ulse red
- Use help plot to see other options

## Multiple Grapfs

- Plot will take any number of arguments grouped in threes ( $\chi$-values, $y$-values, format-info)
- You can actually leave out the format-info (default formatting is used)
- Example: Suppose $a, 6, c$, and d are vectors; plot (a, b, '-', c, d, '*g')
will draw 2 grapfs
- a vs. 6 as a line
- c vs.d as individual points marked by green stars
- Cength(a) must equal lengtf(6)
- lengtf(c) must equal lengtif(d)

## Even Better Drawings

- You can add titles and labels to your drawings
title('Your Fabulous Title')
xlabel ('Name of $\mathbf{x}$-axis')
ylabel ('Name of $y$-axis')
- If you type help plot in the Command Window, there are links to these and other usefuldrawing. related functions

## Drawing a Circle

- Note that cosine (or sine) of a vector produces a vector
function makecircle ( $n$ )
\% Make circle using nsegments
angles $=0: 2{ }^{*} p i / n: 2^{*} p i$;
$x=\cos ($ angles $)$;
$y=\sin ($ angles $)$;
plot $\left(x, y,{ }^{\prime}-g^{\prime}\right)$;
axis equal

## Example: Random Walk

- Write a function randomWalk( $n$ ) to perform $n$ steps of a random walk in the plane starting from $(0,0)$
- Function header: function randomWalk(n)
- At each step, possible moves are up, down, left, or right
- Display the walk
- This part turns out to be easy
- plot $\left(x, y, y^{\prime}\right.$ where $x$ and $y$ are vectors draws connecting lines from $(x(0), y(0))$ to $(x(1), y(1))$ to $(x(2), y(2))$ to...

## Random Walk $\mathcal{A l g o r i t f m}$

- To do the drawing, we need
- Pseudocode all the steps stored in two vectors: $x$ and $y$
- For nsteps we need vectors of lengtr $n+1$
- E.g., if we use vectors of length 2, we can hold
- The starting position $(0,0)$
- And one step to either $(1,0),(0,1),(\cdot 1,0)$, or $(0,-1)$

Load $x$ and $y$ with $n+1$ zeros for each step $K$

Choose a random direction Update $x(k+1)$ and $y(k+1)$ Draw the result
