CS1110   19 February. Recursion

Read: pp. 403-408 but SKIP sect. 15.1.2

Look in ProgramLive CD, page 15-3, for some interesting recursive methods.

Download presented algorithms from the website

Recursive definition: A definition that is defined in terms of itself.

Recursive method: a method that calls itself (directly or indirectly).

Recursion is often a good alternative to iteration (loops), which we cover later. Recursion is an important programming tool. Functional languages have no loops —only recursion.

Recursion: If you get the point, stop; otherwise, see Recursion.
Infinite recursion: See Infinite recursion.

1

```
/** = the number of 'e's in s */
public String noe(String s) {
    if (s.length() == 0) {
        return 0;
    }
    // { s has at least one char }
    return (s[0] = 'e' ? 1 : 0)  + noe(s.substring(1));
}
```

Called the *base case*

Called the *recursive case*

      0 1   s.length()
s [   ]

Express the answer with the same terminology as the specification, but on a smaller scale:

number of 'e's in s = (s[0] = 'e' ? 1 : 0) + number of 'e's in s[1..]

Notation:
s[i] shorthand for s.charAt[i].

s[i..] shorthand for s.substring(i).

2

Two issues in coming to grips with recursion

1. How are recursive calls executed?

2. How do we understand a recursive method and how do we create one?

We discussed the first issue earlier. If you execute a call on a recursive method carefully, using our model of execution, you will see that it works. Briefly, a new frame is created for each recursive call. We do this in the next lecture

DON'T try to understand a recursive method by executing its recursive calls! Use execution only to understand how it works.

3

Factorial: **Understanding a recursive method**

Step 1: HAVE A PRECISE SPECIFICATION

```
// = number of 'e's in s
public static int noe(String  s) {
    if (s.length() == 0) {
        return 0;              base case
    }
    // {s has at least one character} recursive case (has a recursive call)
    // return (s[0] = 'e' ? 1 : 0) + number of 'e's in s[1..];
    return (s[0] = 'e' ? 1 : 0) + noe(s.substring(1));
}
```

Step 2: Check the base case.
When s is the empty string, 0 is returned.
So the base case is handled correctly.

Notation:
s[i] shorthand for s.charAt[i].

s[i..] shorthand for s.substring(i).

4

Understanding a recursive function

s = ""   **base case**
s has at least one character   **recursive case**

Step 3: Recursive calls make progress toward termination.

argument s[1..] is smaller than parameter s, so there is progress toward reaching base case 0

```
// = number of 'e's in s
public static int noe(String  s) {
    if (s.length() == 0) {
        return 0;      base case
    }
    // {s has at least one character} recursive case (has a recursive call)
    return (s[0] = 'e' ? 1 : 0) + noe(s.substring(1));
}
```

Step 4: Recursive case is correct.

parameter s

argument s[1..]

5

Creating a recursive method

Task: Write a method that removes blanks from a String.

0. Specification:

```
/** = s but with its blanks removed */
public static String deblank(String s)
```

precise spec!

Notation:
s[i] shorthand for s.charAt[i].

s[i..] shorthand for s.substring(i).

1. Base case: the smallest String s is "".

```
    if (s.length() == 0)
        return s;
```

2. Other cases: String s has at least 1 character.
```
    return (s[0] == ' ' ? "" : "") + s[1..] with its blanks removed
```

6

1

Slide 7

```
// = s but with its blanks removed
public static String deblank(String s) {
    if (s.length() == 0)  return s;
    // {s is not empty}
    if  (s[0] is a blank)
            return s[1..] with its blanks removed
    // {s is not empty and s[0] is not a blank}
    return s[0] + (s[1..] with its blanks removed);
}
```

Creating a recursive method

The tasks given by the two English, blue expressions are similar to the task fulfilled by this function, but on a smaller String! Rewrite each as

deblank(s[1..]) .

Notation:
s[i] shorthand for s.charAt[i].

s[i..] shorthand for s.substring(i).

7

Slide 8

```
// = s but with its blanks removed
public static String deblank(String s) {
    if (s.length == 0)
            return s;
    // {s is not empty}
    if  (s.charAt(0) is a blank)
            return deblank(s.substring(1));
    // {s is not empty and s[0] is not a blank}
    return s.charAt(0) +
            deblank(s.substring(1));
}
```

Creating a recursive method

Check the four points:
0. Precise specification?
1. Base case: correct?
2. Recursive case: progress toward termination?
3. Recursive case: correct?

8

Slide 9

Check palindrome-hood

A String with at least two characters is a palindrome if
(0) its first and last characters are equal, and
(1) chars between first & last form a palindrome:

have to be the same

e.g. **AMANAPLANACANALPANAMA**
has to be a palindrome

```
/** = "s is a palindrome" */
public static boolean isPal(String s) {
    if (s.length() <= 1)
        return true;

    // { s has at least two characters }
    return s.charAt(0) == s.charAt(s.length()-1)  &&
            isPal(s.substring(1, s.length()-1));
}
```

2^n

2^n
Tiling Elaine's kitchen

Elaine has a 2^n by 2^n kitchen. One square of it is covered by a 1 by 1 refrigerator. Tile the kitchen with these kinds of tiles:

11

Slide 12

2^n

2^n

Tiling Elaine's kitchen

```
/** tile a 2ⁿ by 2ⁿ kitchen. */
public static void tile(int n) {
    if (              )

        }
```
