

**CS1110 31 March 2008**  
**Algorithms on arrays Reading: 8.3-8.5**

The searching, sorting, and other algorithms will be on the course website, along with a JUnit testing class for them.

Haikus (5-7-5) seen on Japanese computer monitors

Yesterday it worked.	Serious error.
Today it is not working.	All shortcuts have disappeared.
Windows is like that.	Screen. Mind. Both are blank.
A crash reduces	The Web site you seek
Your expensive computer	Cannot be located, but
To a simple stone.	Countless more exist.
Three things are certain:	Chaos reigns within.
Death, taxes, and lost data.	Reflect, repent, and reboot.
Guess which has occurred?	Order shall return.

1

Horizontal notation for arrays, strings, Vectors

$$b \begin{array}{|c|c|c|} \hline 0 & & k \\ \hline \leq \text{sorted} & & \geq \\ \hline \end{array} b.\text{length}$$

Example of an assertion about an array b. It asserts that:

- b[0..k-1] is sorted (i.e. its values are in ascending order)
- Everything in b[0..k-1] is  $\leq$  everything in b[k..b.length-1]

---

$$b \begin{array}{|c|c|c|} \hline 0 & h & k \\ \hline \end{array}$$

Given the index h of the First element of a segment and the index k of the element that Follows the segment, the number of values in the segment is k - h.

$$b[h..k-1] \text{ has } k-h \text{ elements in it.}$$

(h+1) - h = 1

2

How to make invariant look like initial condition

pre b  $\begin{array}{|c|c|c|} \hline 0 & & n \\ \hline \end{array}$  ?

inv b  $\begin{array}{|c|c|c|c|} \hline 0 & j & k & l \\ \hline \text{reds} & \text{whites} & ? & \text{blues} \\ \hline \end{array}$  n

- Make red, white, blue section empty: use formulas for no. of values in these sections, set j, k, l so that they have 0 elements.
- Compare precondition with invariant. E.g. in precondition, 0 marks first unknown. In invariant, k marks first unknown. Therefore, k and 0 must be the same.

3

How to learn these algorithms  
 (Need to know dutch national flag and binary search for quiz).

- Practice writing pre- and post-conditions. If we say "Dutch National Flag", you should be able to write them down.
- Practice developing the invariant from the pre- and post-conditions.
- Practice developing the loop (with initialization), using the four loopy questions.

4

**Binary search:** Vague spec: Look for v in sorted array segment b[h..k].  
 Better spec:  
 Precondition P: b[h..k] is sorted (in ascending order).  
 Store in i to truthify:  
 Postcondition Q: b[h..i]  $\leq v$  and  $v < b[i+1..k]$

Called binary search because each iteration of the loop cuts the array segment still to be processed in half

Below, the array is in non-descending order:

pre P: b  $\begin{array}{|c|c|c|} \hline h & & k \\ \hline \end{array}$  ?

post Q: b  $\begin{array}{|c|c|c|} \hline h & i & k \\ \hline \leq v & & > v \\ \hline \end{array}$

	v	i
Eg. b[h..k] is (2, 2, 2, 2, 5, 7, 7, 8)	1	h-1
	2	h+3
	3	h+3
	9	h+7

v in: i is index of rightmost occurrence  
 v not in: it belongs between b[i], b[i+1]

5

**Binary search:** b[h..k] is sorted (ascending order)

pre P: b  $\begin{array}{|c|c|c|} \hline h & & k \\ \hline \end{array}$  ?

post Q: b  $\begin{array}{|c|c|c|} \hline h & i & k \\ \hline \leq v & & > v \\ \hline \end{array}$

Called binary search because each iteration of the loop cuts the array segment still to be processed in half

Write down an invariant

6

**How many iterations does binary search make?**

Suppose  $k-h$  is a power of 2.

How many iterations does binary search perform?

$p$	$s^p$
0	$2^0 = 1$
1	$2^1 = 2$
2	$2^2 = 4$
3	$2^3 = 8$
4	$2^4 = 16$
5	$2^5 = 32$
6	$2^6 = 64$
...	...

$i$	$t$	$(t-i)/2$	so next value of $t$ is
0	16	8	8
0	8	4	4
0	4	2	2
0	2	1	1
0	1		

Requires  $\sim n$  iterations for an array segment of size  $2^n$

7

**Partition algorithm:** Given an array  $b[h..k]$  with some value  $x$  in  $b[h]$ :

P:  $b$   $\begin{matrix} h & & & & k \\ \boxed{x & & & & ?} \end{matrix}$

Swap elements of  $b[h..k]$  and store in  $j$  to truthify P:

Q:  $b$   $\begin{matrix} h & & & j & & & k \\ \boxed{\leq x} & & & x & & & \geq x} \end{matrix}$

change:  $b$   $\begin{matrix} h & & & & & & k \\ \boxed{3 \ 5 \ 4 \ 1 \ 6 \ 2 \ 3 \ 8 \ 1} \end{matrix}$

into  $b$   $\begin{matrix} h & & & j & & & k \\ \boxed{1 \ 2 \ 1 \ 3 \ 5 \ 4 \ 6 \ 3 \ 8} \end{matrix}$

or  $b$   $\begin{matrix} h & & & j & & & k \\ \boxed{1 \ 2 \ 3 \ 1 \ 3 \ 4 \ 5 \ 6 \ 8} \end{matrix}$

$x$  is called the **pivot value**.

$x$  is not a program variable;  $x$  just denotes the value initially in  $b[h]$ .

Algorithm is an important piece of the most famous sorting algorithm, quicksort

8

**Reversal:** Reverse the elements of array segment  $b[h..k]$ .

precondition P:  $b$   $\begin{matrix} h & & & & k \\ \boxed{\text{not reversed}} \end{matrix}$

postcondition Q:  $b$   $\begin{matrix} h & & & & k \\ \boxed{\text{reversed}} \end{matrix}$

Change:  $b$   $\begin{matrix} h & & & & k \\ \boxed{1 \ 2 \ 3 \ 4 \ 5 \ 6 \ 7 \ 8 \ 9 \ 9 \ 9 \ 9} \end{matrix}$

into  $b$   $\begin{matrix} h & & & & k \\ \boxed{9 \ 9 \ 9 \ 9 \ 8 \ 7 \ 6 \ 5 \ 4 \ 3 \ 2 \ 1} \end{matrix}$

9

**Check whether two arrays are equal**

```

/** = "b and c are equal" (both null or both contain
    arrays whose elements are the same) */
public static boolean equals(int[] b, int[] c) {

```

10
