

Lecture 27: Sorting & Searching

CS 1110

Introduction to Computing Using Python

Cornell CIS
COMPUTING AND INFORMATION SCIENCE

[E. Andersen, A. Bracy, D. Gries, L. Lee, S. Marschner, C. Van Loan, W. White]

Sorting with Partitions

- **Idea:** Pick a *pivot* element x
- Partition sequence into $\leq x$ and $\geq x$

Now Partition this and this, too
Keep recursing...

5

QuickSort

```
def quick_sort(b, h, k):
    """Sort the array fragment b[h..k]"""
    if k <= h:
        return
    i = partition(b, h, k)
    # INV: b[h..i-1] <= b[i] <= b[i+1..k]
    # Sort b[h..i-1] and b[i+1..k]
    quick_sort(b, h, i-1)
    quick_sort(b, i+1, k)
```

<https://www.youtube.com/watch?v=m1PS8IR6TD0>

6

Linear Search Definition

- **Vague:** Find first occurrence of v in $b[h..k-1]$.
- **Better:** Store an integer in i to make this post-condition true:
 1. v is not in $b[h..i-1]$
 2. $i = k$ OR $v = b[i]$

9

Implementing Linear Search

```
def linear_search(b, v, h, k):
    """Returns: first occurrence of v in b[h..k-1]"""
    # Store in i index of the first v in b[h..k-1]
    i = h
    # invariant: v is not in b[0..i-1]
    while i < k and b[i] != v:
        i = i + 1
    # post: v is not in b[h..i-1]
    # i >= k or b[i] == v
    return i if i < k else -1
```

11

Binary Search: What's the Invariant?

- Look for v in **sorted** sequence segment $b[h..k]$.
 - **Precondition:** $b[h..k-1]$ is sorted (in ascending order).
 - **Postcondition:** $b[h..i-1] < v$ and $v \leq b[i..k]$

Called binary search because each iteration of the loop cuts the array segment still to be processed in half

13

Q: Binary Search Examples

Example b

h	k
0 1 2 3 4 5 6 7 8 9	
3 3 3 3 3 4 4 6 7 7	

- if v is 3, set i to ?
- if v is 4, set i to ?
- if v is 5, set i to ?
- if v is 8, set i to ?

A: 0
 B: 3
 C: 5
 D: 7
 E: None of the Above

POST: b

h	i	k
v not here	v	?

 OR b

h	k=i
v not here	

 14

Implementing Binary Search

```

pre: b 

|   |   |
|---|---|
| h | k |
| ? |   |

def bsearch(b, v):
    i = 0
    j = len(b)
    inv: b 

|     |   |      |   |
|-----|---|------|---|
| h   | i | j    | k |
| < v | ? | >= v |   |

    while i < j:
        mid = (i+j)/2
        if b[mid] < v:
            i = mid+1
        else: #b[mid] >= v
            j = mid
    if i < len(b) and b[i] == v:
        return i
    else:
        return -1
    post: b 

|     |      |   |
|-----|------|---|
| h   | i    | k |
| < v | >= v |   |

```
