Review 7

Sequence Algorithms

Three Types of Questions

- Write body of a loop to satisfy a given invariant.
 - Problem 6, Spring 2014 (Final)
- Given an invariant with code, identify all errors.
 - Problem 6, Spring 2014 (Prelim 2)
 - Problem 6, Spring 2013 (Final)
- Given an example, rewrite it with new invariant.
 - Problem 8, Fall 2014 (Final)
 - Problem 7, Fall 2018 (Final)

Horizontal Notation for Sequences

Example of an assertion about an sequence b. It asserts that:

- 1. b[0..k–1] is sorted (i.e. its values are in ascending order)
- 2. Everything in b[0..k–1] is \leq everything in b[k..len(b)–1]

h h+1

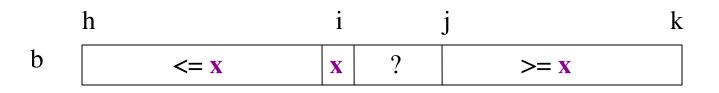

(h+1) - h = 1

Given index h of the first element of a segment and index k of the element that follows that segment, the number of values in the segment is k - h.

b[h ... k - 1] has k - h elements in it.

DOs and DON'Ts #3

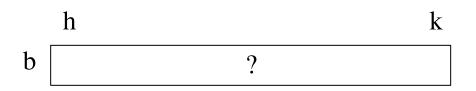

• **DON'T** put variables directly above vertical line.

- Where is j?
- Is it unknown or >= x?

Algorithm Inputs

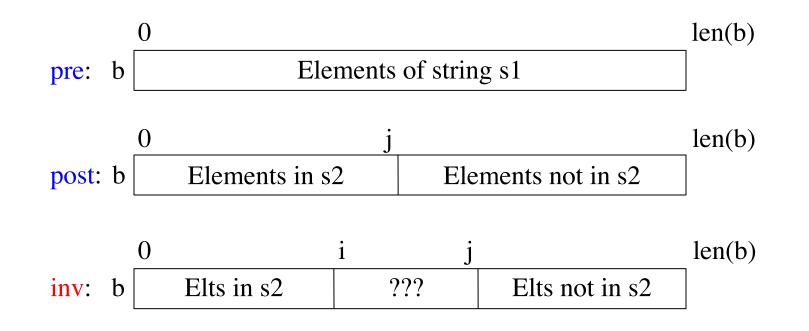

- We may specify that the list in the algorithm is
 - b[0..len(b)-1] or
 - a segment b[h..k] or
 - a segment b[m..n-1]
- Work with whatever is given!

- Remember formula for # of values in an array segment
 - Following First
 - e.g. the number of values in b[h..k] is k+1–h.

Three Types of Questions

- Write body of a loop to satisfy a given invariant.
 - Problem 6, Spring 2014 (Final)
- Given an invariant with code, identify all errors.
 - Problem 6, Spring 2014 (Prelim 2)
 - Problem 6, Spring 2013 (Final)
- Given an example, rewrite it with new invariant.
 - Problem 8, Fall 2014 (Final)
 - Problem 7, Fall 2018 (Final)

• Example:

- Input s1 = 'abracadabra', s2 = 'abc'
- Output 'abacaabardr' (or 'aaaabbcrdr')

What is Fair Game for this Question?

- Segregation (see Fall 2014 Final)
- Partition from Lab 13
- Dutch-National-Flag from Lab 13
- The non-recursive sorting algorithms
 - Insertion Sort (Lecture 27)
 - Selection Sort (Lecture 27)
 - But changing invariants changes helpers too
- Binary Search (Lectures 26 & 27)
