Lecture 23

GUI Applications

Announcements for This Lecture

Prelim 2

- Difficulty was reasonable
 - Mean: 72, Median: 75.5
 - Only shiftkeys surprising
- What do grades mean?
 - **A**: 80-100
 - **B**: 60-80
 - **C**: 30-55
- Final will be about same
 - But a few easier parts

Assignments

- A6 due THURSDAY
 - Complete it by midnight
 - Also, fill out survey
- A7 due **December 7th**
 - Focus of today's lecture
 - 2.5 weeks excluding T-Day
 - 3 weeks including the break
 - Minor extensions possible
- Both are very important
 - Each worth 8% of grade

- Mean: 72,
- Only shiftked
- What do grad
 - **A**: 80-100
 - **B**: 60-100
 - **C**: 30-55

Video Lessons

- Lesson 27 (all) for today
- Videos 28.1-28.7 next time
- Ignore comments on A7

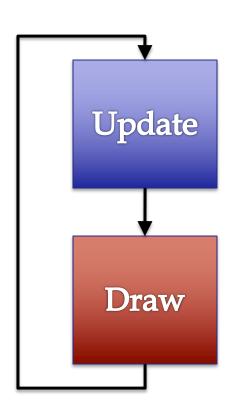

- by midnight
- nt survey
- mber 7th
- hursdays lecture
- xcluding T-Day
- luding the break
- hsions possible

- Final will be about same
 - But a few easier parts

- Both are very important
 - Each worth 8% of grade

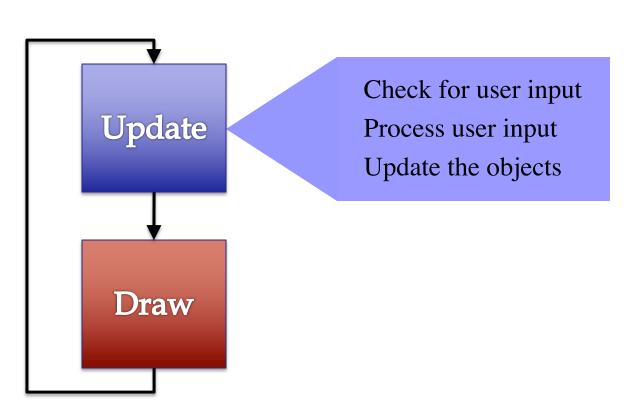

A Standard GUI Application

Animates the application, like a movie

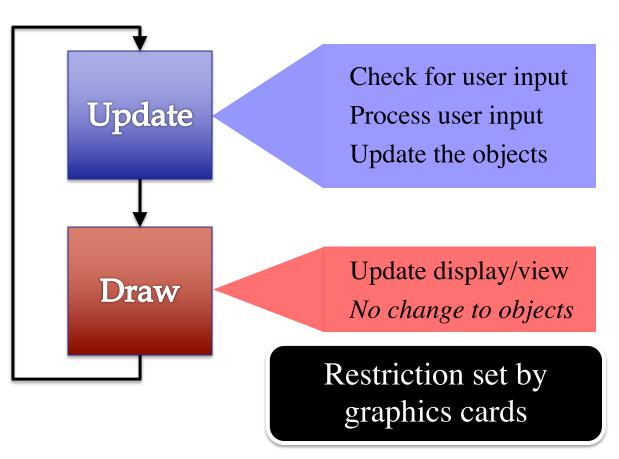

A Standard GUI Application

A Standard GUI Application

Animates the application, like a movie

Must We Write this Loop Each Time?

while program_is_running:

- # Get information from mouse/keyboard
- # Handled by OS/GUI libraries
- # Your code goes here

- # Draw stuff on the screen
- # Handled by OS/GUI libraries

Must We Write this Loop Each Time?

while program_is_running:

Handled by OS/GUI libraries

```
# Ge Would like to "plug in" code libraries

# Your code goes here

# Draw stuff on the screen
```

Must We Write this Loop Each Time?

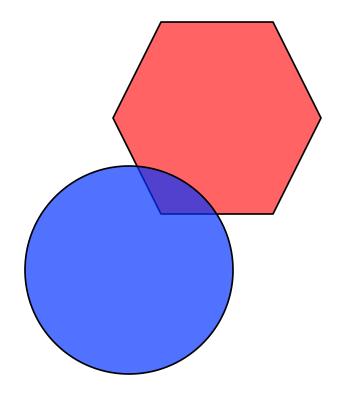

while program_is_running:

- # Get information from mouse/keyboard # Handled Method call (for loop body) # Your code application.update() **Custom Application class** with its own attributes #
 - Write loop body in an app class.
 - OS/GUI handles everything else.

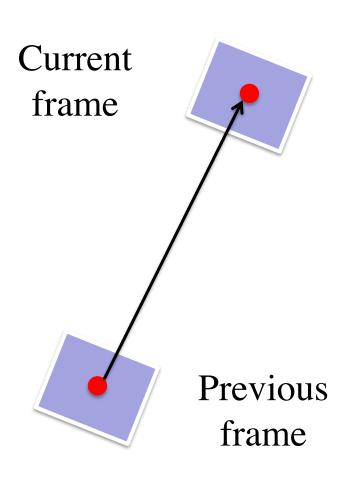

Programming Animation

Intra-Frame

- Computation within frame
 - Only need current frame
- Example: Collisions
 - Need current position
 - Use to check for overlap
- Can use local variables
 - All lost at update() end
 - But no longer need them

Programming Animation

Inter-Frame

- Computation across frames
 - Use values from *last* frame
- Example: Movement
 - Need old position/velocity
 - Compute next position
- Requires attributes
 - Attributes never deleted
 - Remain after update() ends

Variables and the Loop

```
while program_is_running:
```

- # Get information from mouse/keyboard
- # Handled by OS/GUI libraries
- # Your code goes here
- application.update()

Local variables erased. But **attributes** persist.

- # Draw stuff on the screen
- # Handled by OS/GUI libraries

Programming Animation

Intra-Frame

- Computation within frame
 - Only need current frame
- Example: Collisions
 - Need current position
 - Use to check for overlap
- Can use local variables
 - All lost at update() end
 - But no longer need them

Inter-Frame

- Computation across frames
 - Use values from last frame
- Example: Movement
 - Need old position/velocity
 - Compute next position
- Requires attributes
 - Attributes never deleted
 - Remain after update() ends

Attributes = Loop Variables

Normal Loops

Application

```
Variables "external"
to the loop body
i = 2
# x = sum of squares of 2..i-1
while i <= 5:

x = x + i*i
i = i +1

# x = sum of squares of 2..5
```

Attributes are the "external" variables

while program_running:

```
# Get input
# Your code called here
application.update()
# Draw
```

The Actual Game Loop

```
# Constructor
                          Too early to initialize
                               everything
game = GameApp(...)
                                            Actual loop
game.start() #Loop initialization
                                           initialization
while program_running:
  # Get input
  # Your code goes here
                                     Separate update()
  game.update(time_elapsed)
                                    and draw() methods
  game.draw()
```

Designing a Game Class: Animation

```
class Animation(game2d.GameApp):
  """App to animate an ellipse in a circle."""
  def start(self):
     """Initializes the game loop."""
  def update(self,dt):
     """Changes the ellipse position."""
     ...
  def draw(self):
     """Draws the ellipse"""
     ...
```

See animation.py

16

Designing a Game Class: Animation

```
class Animation(game2d.GameApp):
  """App to animate an
                              Parent class that
                               does hard stuff
  def start(self):
     """Initializes the game loop."""
  def update(self,dt):
     """Changes the ellipse position."""
     ...
 def draw(self):
     """Draws the ellipse"""
     ...
```

See animation.py

Designing a Game Class: Animation

```
class Animation(game2d.GameApp):
                                                     See animation.py
  """App to animate an
                             Parent class that
                             does hard stuff
  def start(self):
     """Initializes the game loop."""
                                             Loop initialization
                                           Do NOT use __init
  def update(self,dt):
     """Changes the ellipse position.""
                                      Loop body
     ...
 def draw(self):
     """Draws the ellipse"""
                                  Use method draw()
                                  defined in GObject
     ...
```

GUI Applications

18

11/16/21

Comparing Attributes: Touch

- Attribute touch in GInput
 - The mouse press position
 - Or None if not pressed
 - Access with self.input.touch
- Compare touch, last position
 - Mouse button pressed: last None, touch not None
 - Mouse button released:
 last not None, touch None
 - Mouse dragged:
 last and touch not None

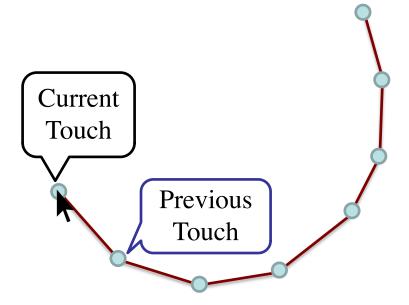

Line segment = 2 points Current Touch Previous Touch See touch.py

Input and Invariants

- Attribute input is...
 - A GInput object
- Attribute input.touch is...
 - Either a Point2 or None
 - Location of mouse cursor (if it is pressed)
- Attribute last is...
 - Either a Point2 or None
 - input.touch in prev. frame

Relationship between two variables.

Line segment = 2 points

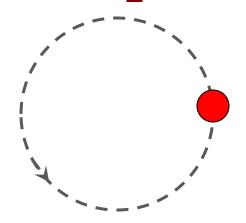

See touch.py

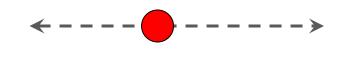

State: Changing What the Loop Does

- **State**: Current loop activity
 - Playing game vs. pausing
 - Ball countdown vs. serve
- Add an attribute state
 - Method update() checks state
 - Executes correct helper
- How do we store state?
 - State is an *enumeration*;
 one of several fixed values
 - Implemented as an int

State ANIMATE_CIRCLE

State ANIMATE_HORIZONTAL

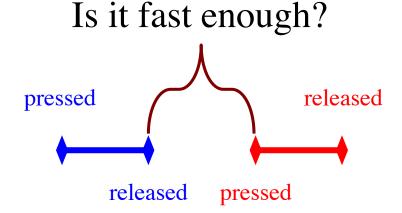

See state.py

Designing States

- Each state has its *own set* of invariants.
 - Drawing? Then touch and last are not None
 - Erasing? Then touch is None, but last is not
- Need rules for when we switch states
 - Could just be "check which invariants are true"
 - Or could be a triggering event (e.g. key press)
- Need to make clear in class invariant
 - What are the invariants for each state?
 - What are the rules to switch to a new state?

Triggers: Checking Click Types

- Double click = 2 fast clicks
- Count number of fast clicks
 - Add an attribute clicks
 - Reset to 0 if not fast enough
- Time click speed
 - Add an attribute time
 - Set to 0 when mouse released
 - Increment when not pressed (e.g. in loop method update())
 - Check time when next pressed

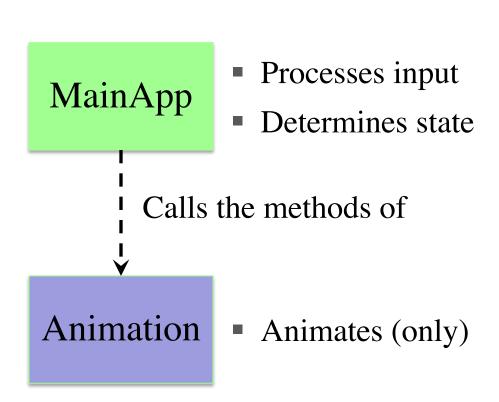

See touch.py

time

Designing Complex Applications

- Applications can become extremely complex
 - Large classes doing a lot
 - Many states & invariants
 - Specification unreadable
- Idea: Break application up into several classes
 - Start with a "main" class
 - Other classes have roles
 - Main class delegates work

See subcontroller.py

How to Break Up: Software Patterns

- Pattern: reusable solution to a common problem
 - Template, not a single program
 - Tells you how to design your code
 - Made by someone who ran into problem first
- In many cases, a pattern gives you the interface
 - List of headers for non-hidden methods
 - Specification for non-hidden methods
 - Only thing missing is the implementation

Just like this course!

Model-View-Controller Pattern

Division can apply to classes or modules

Controller

- Updates model in response to events
- Updates view with model changes

Calls the methods or functions of

Model

- Defines and manages the data
- Responds to the controller requests

View

- Displays the model to the app user
- Provides user input to the controller

MVC in this Course

Model

- A3: Color classes
 - RGB, CMYK & HSV
- A4: Turtle, Pen
 - Window is View
- A6: Dataset, Cluster
 - Data is always in model
- A7: Ship, Alien, etc..
 - All shapes/geometry

Controller

- **A3**: a3app.py
 - Hidden classes
- A4: Functions in a4.py
 - No need for classes
- A6: Algorithm
 - Drives program forward
- A7: Invaders, Wave
 - Main part of assignment!

- A7: Invaders, Wave
 - Main part of assignment!

Model-View-Controller in CS 1110

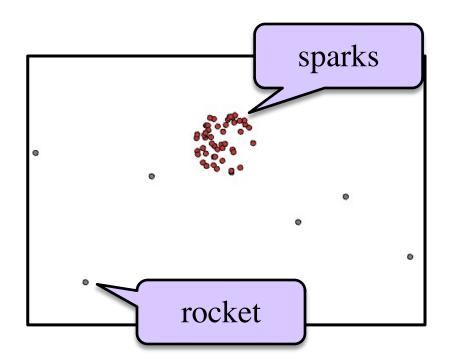

Controller Other attributes Attribute view Subclass of (defined by you) (inherited) GameApp Model View Method draw in GObject Subclasses of GObject Class GView, GInput GEllipse, GImage, ... Do not subclass! Often more than one Part of GameApp Classes in game2d 11/16/21 **GUI** Applications 29

Model-View-Controller in CS 1110

Models in Assignment 7

- Often subclass of GObject
 - Has built-in draw method
- Includes groups of models
 - **Example**: rockets in pyro.py
 - Each rocket is a model
 - But so is the entire list!
 - update() will change both
- A7: Several model classes
 - Ship to animate the player
 - Alien to represent an alien

See pyro.py
