

Lecture 25

Coroutines

Announcements for This Lecture

Assignment & Lab

- A6 is not graded yet
 - Done early next week
 - Survey still open today
- A7 due **Tues, Dec. 7**
 - Extensions are possible
 - Contact your lab instructor
- Lab Today: Office Hours
 - Get help on A7 aliens
 - Anyone can go to any lab

Optional Videos

- **ALL** all are now posted
 - **Lesson 29** for **today**
 - **Lesson 30** is the last

Animating Objects

- **Naïve** animations are easy
 - Look at the key input right now
 - Move the objects based on the keys
 - Redraw the moved objects
- **Timed** animations are harder
 - Press a key to start the animation
 - Animation continues for X seconds
 - Animation stops automatically when done

`animate1.py`

`animate2.py`

Animation Needs Many Attributes

```
def _animate_turn(self,dt):
    """Animates a rotation of the image over SPEED seconds"""
    # Compute degrees per second
    steps = (self._fangle-self._sangle)/SPEED
    amount = steps*FRAME_RATE
    # Update the angle
    self.image.angle = self.image.angle+amount
    # If we go to far, clamp and stop animating
    if abs(self.image.angle-self._sangle) >= 90:
        self.image.angle = self._fangle
        self._animating = False
```

Animation Needs Many Attributes

```
def _animate_turn(self,dt):  
    """ New Attribute n of the image over SPEED seconds """  
    # Compute degrees per second  
    steps = (self._fangle-self._sangle)/SPEED  
    amount = steps*FRAME_RATE  
    # Update the angle  
    self.image.angle = self.image.angle+amount  
    # If we go to far, clamp and stop animating  
    if (self.image.angle-self._sangle) >= 90:  
        self.image.angle = self._fangle  
        self._animating = False
```

Wouldn't a Loop Be Simpler?

```
def _animate_turn(self,direction):
    """Animates a rotation of the image over SPEED seconds"""
    sangle = self.image.angle
    fangle = sangle+90 if direction == 'left' else sangle-90
    steps = (fangle-sangle)/ANIMATION_SPEED      # Degrees per second
    animating = True
    while animating:
        amount = steps*FRAME_RATE
        self.image.angle = self.image.angle+amount      # Update the angle
        if abs(self.image.angle-sangle) >= 90:
            self.image.angle = fangle
            animating = False
```

Wouldn't a Loop Be Simpler?

```
def _animate_turn(direction, speed):
    """Animates a rotation of the image over SPEED seconds"""
    sangle = self.image.angle
    fangle = sangle+90 if direction == 'left' else sangle-90
    steps = (fangle-sangle)/ANIMATION_SPEED # Degrees per second
    animating = True
    while animating:
        amount = steps*FRAME_RATE
        self.image.angle = self.image.angle+amount
        if abs(self.image.angle-sangle) >= 90:
            self.image.angle = fangle
            animating = False
```

Only Attribute

Loop is explicit.
Animate until done.

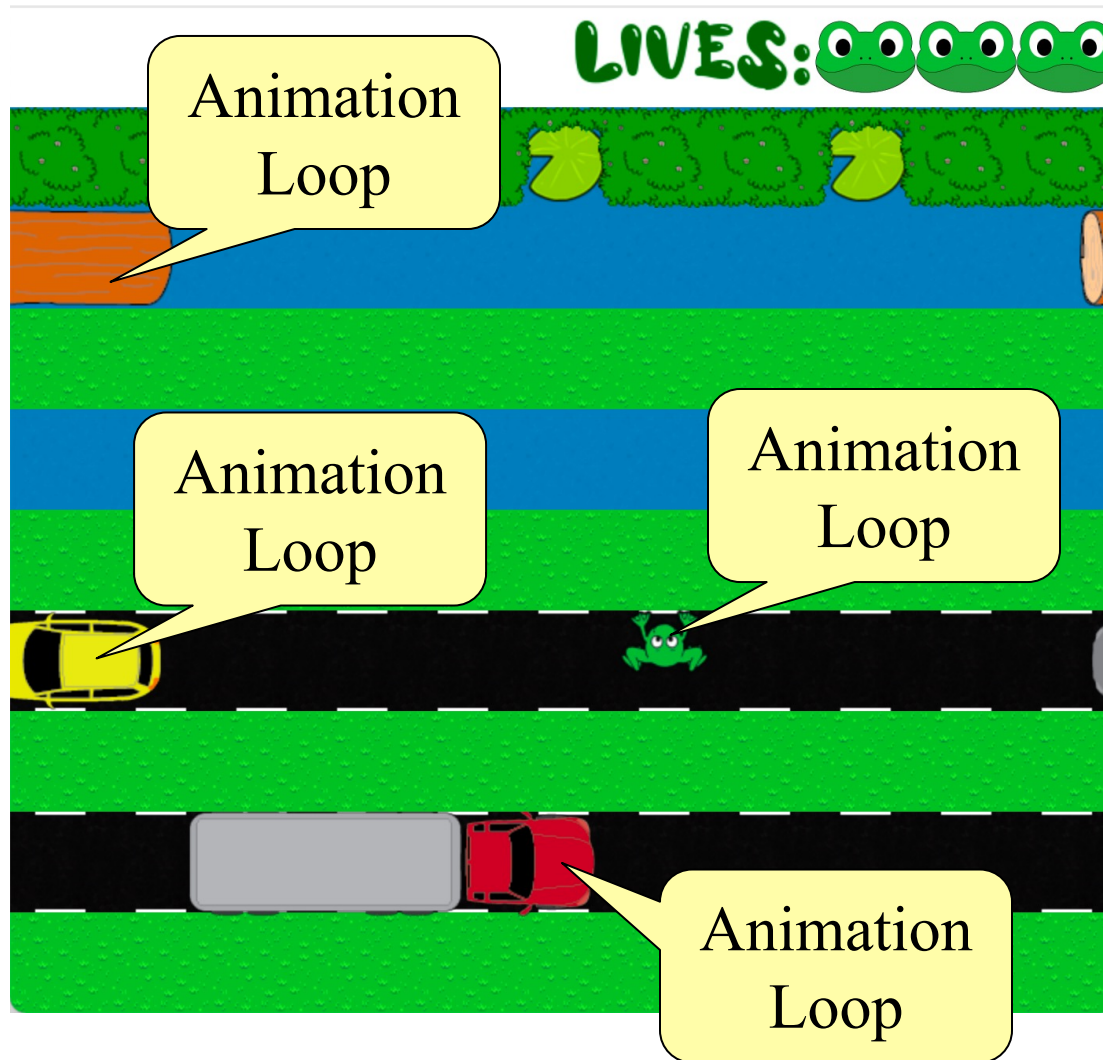

But This is Not Going to Work

- **This won't actually draw anything!**
 - This function is a helper to `update()`
 - Keeps running until animation done
 - Method `draw()` only called **at the end**
- Cannot `draw()` inside of `update()`
 - All drawing must be at **same time**
 - What about all the other animations?
- Need some way to “break up” the loop

Doing this With a Bunch of Animations

Doing this With a Bunch of Animations

Doing this With a Bunch of Animations

What Do We Mean by Multitasking?

Concurrency

- All programs *make progress*
 - Switch between programs
 - Switches are very fast (μ s)
- Looks/feels simultaneous

Multitasking on
old hardware

Parallelism

- Programs *run at same time*
 - Each program gets CPU/core
 - No switching between progs
- Actually is simultaneous

Multitasking on
modern hardware

An Important Distinction

Concurrency

Parallelism

Switching in Currency

Preemptive

- Can switch at any time
 - Even in middle of command!
 - Cannot prevent switching
- Very **hard to program** for
 - Must prepare for anything!
 - Debugging is a total nightmare
- Popularized by Unix systems
 - Many users on one machine
 - All need “equal” access

Cooperative

- Only switch at special points
 - Program specifies when okay
 - Returns back to this spot
- Can be easily **abused**
 - Program never specifies okay
 - That program hogs machine
- Popular in early days of GUIs
 - Okay for main app to hog
 - No expectation of other apps

Switching in Currency

Preemptive

- Can switch at any time
 - Even in middle of command!
 - Cannot prevent switching
- **Implement with threads**
- Popularized by Unix systems
 - Many users on one machine
 - All need “equal” access

Cooperative

- Only switch at special points
 - Program specifies when okay
 - Returns back to this spot
- **Implement with coroutines**
- Popular in early days of GUIs
 - Okay for main app to hog
 - No expectation of other apps

Preemptive Largely Won Out

- Modern OSs moved away from cooperative
 - Windows went preemptive with Windows 95
 - MacOS went preemptive with MacOS X
- Why? The rise of **parallelism**
 - Threads can be concurrent **and** parallel
 - Coroutines are not (easily) parallel
- But threads have **never** gotten easier
 - We have tried for decades (many PhD theses)
 - Still the source of a lot of buggy code

But Coroutines Are Coming Back

- Have figured better ways to parallelize
 - Not as good as threads in general
 - But better/easier for certain applications
- Sometimes explicit coordination is good
 - **Example:** Client-server communication
 - One waits for the other until it responds
- And also relevant to graphical applications
 - They make a lot of animation code easier
 - Used heavily by the Unity game engine

Aside: Subroutine

- A **subroutine** is a piece of code that
 - Is a set of frequently used instructions
 - Performs a specific task, packaged as a unit
 - Often serves to aid a larger program (routine)
- This sounds just like a function!
 - Not all programming languages have functions
 - This is a generic term that applies to all
- Not a term commonly in use these days

Subroutines vs Coroutines

Subroutine

- Runs until completed
 - Invoked by parent routine
 - Runs until reach the end
 - Returns output to parent
- Just like a function call
 - Parent is “frozen”
 - Subroutine/function runs
 - Parent resumes when done

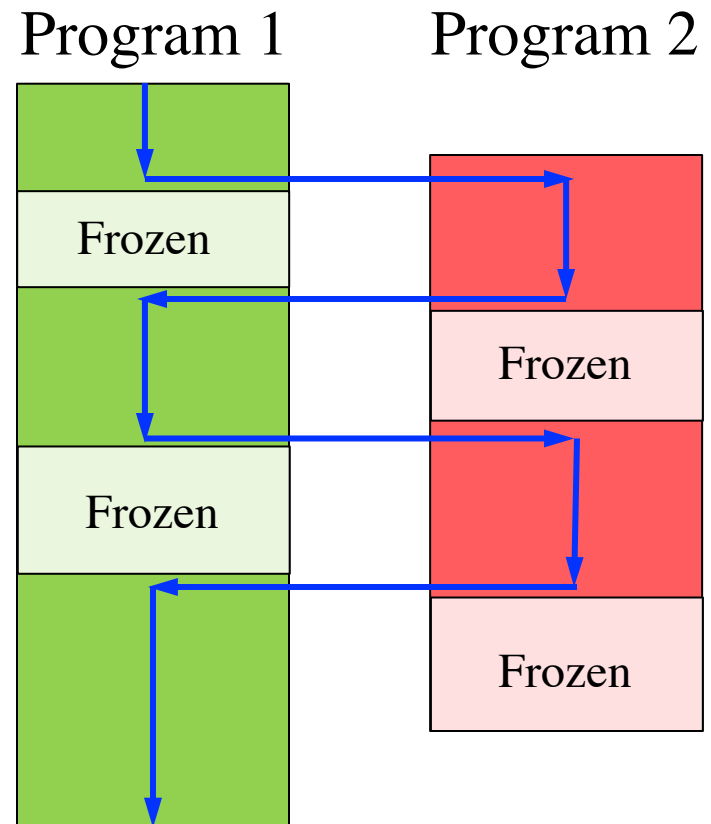

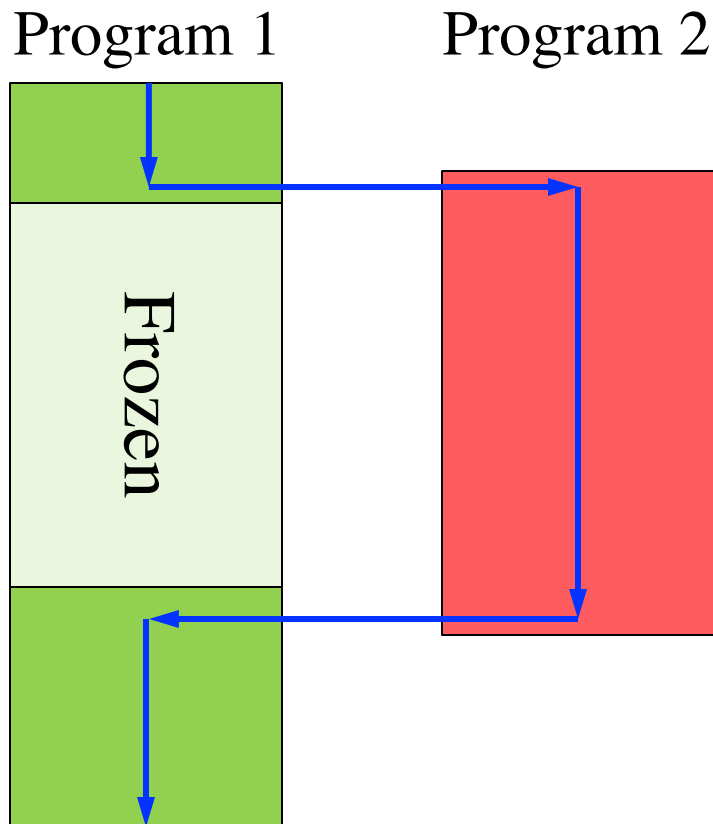

Coroutine

- Can stop and start
 - Runs for a little while
 - Returns control to parent
 - And then picks up again
- *Kind of* like a generator
 - Starts up at initial call
 - Can yield execution
 - Resumes with full state

Subroutines vs Coroutines

Subroutine

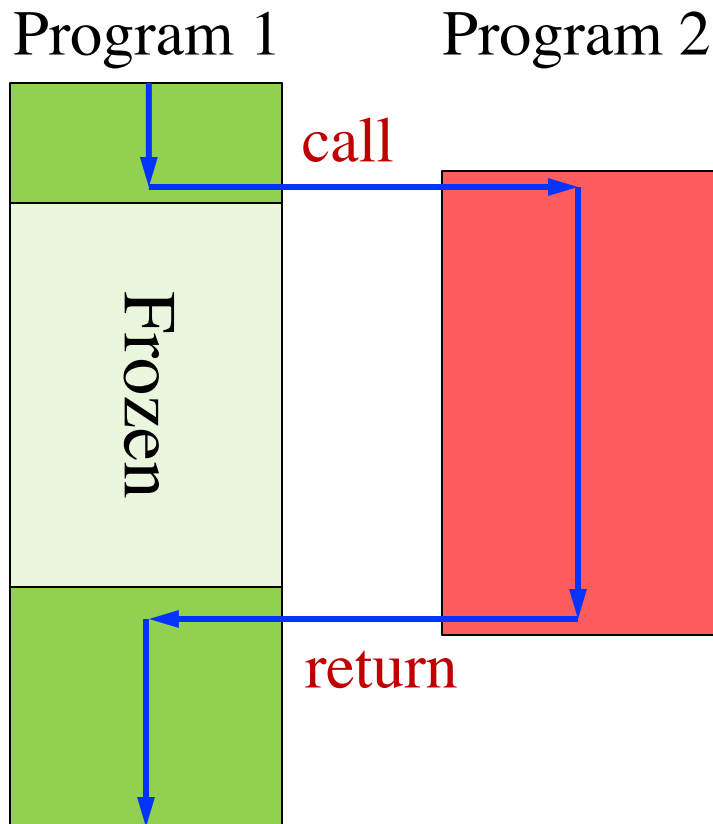

Coroutine

Subroutines vs Coroutines

Subroutines vs Coroutines

Subroutine

Coroutine

Same Animation with Generator

```
def _animate_turn(self,direction):
    """Animates a rotation of the image over SPEED seconds"""
    sangle = self.image.angle
    fangle = sangle+90 if direction == 'left' else sangle-90
    steps = (fangle-sangle)/ANIMATION_SPEED      # Compute degrees per second
    animating = True
    while animating:
        amount = steps*FRAME_RATE
        self.image.angle = self.image.angle+amount    # Update the angle
        if abs(self.image.angle-sangle) >= 90:
            self.image.angle = fangle
            animating = False
        yield                                         # Pause to draw
```

Same Animation with Generator

```
def _animate_turn(self, direction):  
    """Animates a rotation of the image over SPEED seconds"""  
    sangle = self.image.angle  
    fangle = sangle+90 if direction == 'left' else sangle-90  
    steps = (fangle-sangle)/ANIMATION_SPEED      # Compute degrees per second  
    animating = True  
    while animating:  
        amount = steps*FRAME_RATE  
        self.image.angle+=amount      # Update the angle  
        if abs(fangle-self.image.angle) >= 90:  
            self.image.angle = fangle  
            animating = False  
        yield      # Pause to draw
```

Add this
one line

yield

Also Need to Drive The Animation

```
def update(self,dt):
    """Animates the image."""
    if not self._animator is None:      # Something to animate
        try:
            next(self._animator)        # Step animation forward
        except StopIteration:
            self._animator = None       # Stop animating

    elif self.input.is_key_down('left'): # Start animation on press
        self._animator = self._animate_turn('left')

    ...
```

Also Need to Drive The Animation

```
def update(self,dt):  
    """Animates the image."""  
    if not self._animator is None: # Continue to animate  
        try:  
            | next(self._animator) # Forward  
        except StopIteration:  
            | self._animator = None # Stop animating  
  
    elif self.input.is_key_down('left'): # press  
        | self._animator = self._animate_turn(...) # press  
  
    ...
```

Ignore input if
still animating

Otherwise start
animation for
given input

Also Need to Drive The Animation

```
def update(self,dt):
    """Animates the image."""
    if not self._animator is None:      # Something to animate
        try:
            next(self._a)                # Animation forward
        except StopIteration:
            self._animator = None        # Stop animating

    elif self.input.is_key_down('left'): # Start animation on press
        self._animator = self._animate_turn('left')
    ...
```

**update is parent
of the coroutine**

So Are Coroutines Just Generators?

- Generators are an **example** of a coroutine
 - Have parent-child relationship
 - Use `next()` to transfer control to child
 - Child uses `yield` to transfer control back
- But coroutines are a little bit more
 - There is communication **back-and-forth**
 - Yield can give information back to parent
 - But next gives no information to child

So Are Coroutines Just Generators?

- Generators are an **example** of a coroutine
 - Have parent-child relationship
 - Use `next()` to transfer control to child
 - Child uses `yield` to transfer control back
- But coroutines are a little bit more
 - The
 - Yie
 - But

Need another command

Recall: The **yield** Statement

- **Format:** `yield <expression>`
 - Used to produce a value
 - But it **does not stop** the “function”
 - Useful for making iterators
- **But:** These are not normal functions
 - Presence of a `yield` makes a **generator**
 - Function that returns an iterator

Recall: The **yield** Statement

- **Format:** `yield <expression>`
 - Used to produce a value
 - But it **does not stop** the “function”
 - Useful for making iterators
- **But:** These are not normal functions
 - Pre
 - Fur

How do other direction?

Generators Have a **send** Method

- Generators have a `send()` method
 - `a = mygenerator()`
 - `b = next(a)` # progress and get a value
 - `a.send(val)` # sends a value back
- Sends to a **yield expression**
 - **Format:** `(yield)` # parentheses are necessary
 - Typically used in an assignment
 - **Example:** `value = (yield)`

Generators Have a **send** Method

- Generators have a `send()` method
 - `a = mygenerator`
 - `b = next(a)` # `a` value
 - `a.send(val)` # sends a value back
- Sends to a **yield expression**
 - **Format:** `(yield)` # parentheses are necessary
 - Typically used in an assignment
 - **Example:** `value = (yield)`

Must always start with `next()`

→ line that has just executed
→ next line to execute

Continue to move forward with send()

Can Do Both Output and Input

- **Format:** `var = (yield expr)`
 - Coroutine evaluates `expr` and outputs it
 - Coroutine stops and lets parent resume
 - When coroutine resumes, new value in `var`

- **Example:**

```
def give_receive(n):  
    """Receives n values as input and prints them"""  
    for x in range(n):  
        value = (yield x)  
        print('Received '+repr(value))

Program output:

Application: Animation Smoothing

- Our animation sequence is **timed**
 - We needed to keep track of the time
 - Did that with the constant `FRAME_RATE`
 - Assumes a consistent **60 frames per second**
- But what if we do not actually have that?
 - The animation will be jerky (**this is okay**)
 - The animation will run too long (**this is not**)
- **Example:** Set `MAKE_LAG` to `True`

Animation Smoothing with Coroutines

```
def _animate_turn(self,direction):
    """Animates a rotation of the image over SPEED seconds"""
    sangle = self.image.angle
    fangle = sangle+90 if direction == 'left' else sangle-90
    steps = (fangle-sangle)/ANIMATION_SPEED      # Compute degrees per second
    animating = True
    while animating:
        dt = (yield)                             # Get time to animate
        amount = steps*dt
        self.image.angle = self.image.angle+amount    # Update the angle
        if abs(self.image.angle-sangle) >= 90:
            self.image.angle = fangle
            animating = False
```

Animation Smoothing with Coroutines

```
def _animate_turn(self, direction):  
    """Animates a rotation of the image over SPEED seconds"""  
    sangle = self.image.angle  
    fangle = sangle - 90 if direction == 'left' else sangle + 90  
    steps = (fangle - sangle) / 90 # Compute degrees per second  
    animating = True  
    while animating:  
        dt = (yield) # Get time to animate  
        amount = steps * dt  
        self.image.angle = self.image.angle + amount # Update the angle  
        if abs(self.image.angle - sangle) >= 90:  
            self.image.angle = fangle  
            animating = False
```

Get the current dt as input each time

Parent Code Also Needs Tweaking

```
def update(self,dt):
    """Animates the image."""
    if not self._animator is None:      # Something to animate
        try:
            self._animator.send(dt)      # Tell it secs to animate
        except StopIteration:
            self._animator = None        # Stop animating
    elif self.input.is_key_down('left'):
        self._animator = self._animate_turn('left')
        next(self._animator)            # Start up the animator
    ...
```

Parent Code Also Needs Tweaking

```
def update(self,dt):  
    """Animates the image."""  
    if not self._animator is None: # Something to animate  
        try:  
            self._animator.send(dt) # Send dt to the  
                                     yield expression  
        except:  
            self._animator = None # Stop animating  
    elif self.input.is_key_down('left'):  
        self._animator = self._animate_turn # Start coroutine  
        next(self._animator) # after creating it  
    ...
```

Coroutines and Animation

- Popular approach in Unity game engine
 - Coding is in C#, not Python
 - But it has a **yield** and coroutines
- Because the Unity engine is **complicated**
 - Will not let you touch the core loop
 - You can only add custom animation scripts
 - With coroutines, get to program with the loop
- This is all cutting edge!
 - C++ added coroutines in 2020

Optional Exercise

New Application: Counting Words

```
counts = { }           # Store the word count
word = ""              # Accumulator to build word
for x in text:
    if x.isalpha():    # Word continues
        | word = word+x
    else:              # Word ends
        | # Add it if not empty
        | if word != "":
        |     | add_word(word,counts)
        | word = ""    # Reset the accumulator
```

read0.py

What if text
is really long?

Progress Monitoring

- Want some way to measure progress
 - Graphical progress bar
 - Or even just print statements
- But do not want it inside the function
 - Want the user to be able to customize this
 - So the **calling function** monitors progress
- No way to do with simple function
 - We only know the progress when complete

Application: Counting Words

```
for pos in range(len(text)):
    if pos % interval == 0:
        yield progress
    if x.isalpha():      # Word continues
        word = word+x
    else:                # Word ends
        # Add it if not empty
        if word != "":
            add_word(word,counts)
        word = ""        # Reset the accumulator
```

Periodically
notify caller

read1.py

The Parent Caller

```
loader = wordcount(file)      # Create coroutine  
result = None
```

read1.py

```
# Keep going as long as the loader has more
```

```
while not loader is None:
```

```
    try:
```

```
        amount = next(loader)    # Load some more data
```

```
        show_progress(amount)
```

```
    except StopIteration as e:
```

```
        result = e.args[0]       # Access the return value
```

```
        loader = None           # We are done
```
