  - Review
  - Color as a 3-vector
  - Linear interpolation
- Today's Lecture:
  - Finite/inexact arithmetic
  - Plotting continuous functions using vectors and vectorized code
  - Introduction to user-defined functions
- Announcement:
  - Prelim I tonight, Feb 25<sup>th</sup> at 7:30pm
    - Last names A-O in Statler Aud. main floor
    - Last names P-Z in Statler Aud. balcony

## Discrete vs. continuous

## Generating tables and plots

x	sin(x)
0.000	0.000
0.784	0.707
1.571	1.000
2.357	0.707
3.142	0.000
3.927	-0.707
4.712	-1.000
5.498	-0.707
6.283	0.000

*x, y are vectors. A vector is a 1-dimensional list of values*

```
x = linspace(0, 2*pi, 9);
y = sin(x);
plot(x, y)
```

Note: x, y are shown in columns due to space limitation; they should be rows.

## Built-in function linspace

```
x = linspace(1, 3, 5)
```

x [ 1.0 1.5 2.0 2.5 3.0 ]

```
x = linspace(0, 1, 101)
```

x [ 0.00 0.01 0.02 ... 0.99 1.00 ]

Left endpoint

Right endpoint

Number of points

How did we get all the sine values?

Built-in functions accept arrays

[ 0.00 1.57 3.14 4.71 6.28 ]

sin

and return arrays

[ 0.00 1.00 0.00 -1.00 0.00 ]

x	sin(x)
0.00	0.0
1.57	1.0
3.14	0.0
4.71	-1.0
6.28	0.0

Examples of functions that can work with arrays

```
x = linspace(0, 1, 200);
y = exp(x);
plot(x, y)
```

```
x = linspace(1, 10, 200);
y = log(x);
plot(x, y)
```

Does this assign to  $y$  the values  
 $\sin(0^\circ)$ ,  $\sin(1^\circ)$ ,  $\sin(2^\circ)$ , ...,  $\sin(90^\circ)$ ?

```
x = linspace(0,pi/2,90);
```

```
y = sin(x);
```

A: yes    B: no

Lecture 9

10

Can we plot this?

See [plotComparison.m](#)

$$f(x) = \frac{\sin(5x) \exp(-x/2)}{1+x^2} \quad \text{for } -2 \leq x \leq 3$$

Yes!

```
x = linspace(-2,3,200);
y = sin(5*x).*exp(-x/2)./(1 + x.^2);
plot(x,y)
```

 Element-by-element arithmetic  
 operations on arrays

February 23, 2010

Lecture 9

13

Element-by-element arithmetic operations on arrays...  
 Also called "vectorized code"

```
x = linspace(-2,3,200);
y = sin(5*x).*exp(-x/2)./(1 + x.^2);
```

$x$  and  $y$  are vectors

Contrast with scalar operations that we've used  
 previously...

```
a = 2.1;
b = sin(5*a);
```

$a$  and  $b$  are scalars

The operators are (mostly) the  
 same; the operands may be  
 scalars or vectors.

When an operand is a vector,  
 you have "vectorized code."

February 23, 2010

Lecture 9

14

Vectorized code

—a Matlab-specific feature

See Sec 4.1 for list of vectorized  
 arithmetic operations

- Code that performs element-by-element  
 arithmetic/relational/logical operations on array  
 operands in one step
- Scalar operation:  $x + y$   
 where  $x, y$  are scalar variables
- Vectorized code:  $x + y$   
 where  $x$  and/or  $y$  are vectors. If  $x$  and  $y$  are both  
 vectors, they must be of the same shape and length

February 23, 2010

Lecture 9

17

Vectorized multiplication

```

      a  [ 2  1 .5  8 ]
x      b  [ 1  2  0  1 ]
-----
=      c  [ 2  2  0  8 ]
    
```

Matlab code:  $c = a .* b$

February 23, 2010

Lecture 9

18

Vectorized code

element-by-element arithmetic operations  
 on arrays

See full list of ops in §4.1

```

[ ] + [ ] → [ ]
[ ] - [ ] → [ ]
    
```

```

[ ] .* [ ] → [ ]
[ ] ./ [ ] → [ ]
[ ] .^ [ ] → [ ]
    
```

A dot (.) is necessary in front of these math operators

Vectorized code See full list of ops in §4.1

element-by-element arithmetic operations between an array and a scalar

$\boxed{\phantom{000000}} + \boxed{\phantom{000000}}$      $\boxed{\phantom{000000}} + \boxed{\phantom{000000}}$   
 $\boxed{\phantom{000000}} - \boxed{\phantom{000000}}$      $\boxed{\phantom{000000}} - \boxed{\phantom{000000}}$   
 $\boxed{\phantom{000000}} * \boxed{\phantom{000000}}$      $\boxed{\phantom{000000}} * \boxed{\phantom{000000}}$   
 $\boxed{\phantom{000000}} / \boxed{\phantom{000000}}$      $\boxed{\phantom{000000}} / \boxed{\phantom{000000}}$

$\boxed{\phantom{000000}} .^+ \boxed{\phantom{000000}}$      $\boxed{\phantom{000000}} .^+ \boxed{\phantom{000000}}$   
 $\boxed{\phantom{000000}} .^* \boxed{\phantom{000000}}$      $\boxed{\phantom{000000}} .^* \boxed{\phantom{000000}}$

A dot (.) is necessary in front of these math operators

The dot in  $\boxed{\phantom{000000}} .^* \boxed{\phantom{000000}}$ ,  $\boxed{\phantom{000000}} .^+ \boxed{\phantom{000000}}$ ,  $\boxed{\phantom{000000}} ./ \boxed{\phantom{000000}}$  not necessary but OK

February 23, 2010 Lecture 9 22

Computer Arithmetic—floating point arithmetic

Suppose you have a calculator with a window like this:

$\boxed{+} \boxed{2} \boxed{4} \boxed{1} \boxed{-} \boxed{3}$

representing  $2.41 \times 10^{-3}$

26

Floating point addition

$\boxed{+} \boxed{2} \boxed{4} \boxed{1} \boxed{-} \boxed{3}$

$\boxed{+} \boxed{1} \boxed{0} \boxed{0} \boxed{-} \boxed{4}$

Result:  $\boxed{+} \boxed{2} \boxed{5} \boxed{1} \boxed{-} \boxed{3}$

28

Floating point addition

$\boxed{+} \boxed{2} \boxed{4} \boxed{1} \boxed{-} \boxed{3}$

$\boxed{+} \boxed{1} \boxed{0} \boxed{0} \boxed{-} \boxed{6}$

Result:  $\boxed{+} \boxed{2} \boxed{4} \boxed{1} \boxed{-} \boxed{3}$

Not enough room to represent .002411

31

The loop DOES terminate given the limitations of floating point arithmetic!

```

k = 0;
while 1 + 1/2^k > 1
    k = k+1;
end
disp(k)
    
```

$1 + 1/2^{53}$  is calculated to be just 1, so "53" is printed.

32

### Patriot missile failure

In 1991, a Patriot Missile failed, resulting in 28 deaths and about 100 injured. The cause?

0.1

Lecture 8

33

### Computer arithmetic is *inexact*

- There is error in computer arithmetic—floating point arithmetic—due to limitation in “hardware.” Computer memory is **finite**.
- What is  $1 + 10^{-16}$  ?
  - 1.0000000000000001 in real arithmetic
  - 1 in floating point arithmetic (IEEE)
- Read Sec 4.3

Lecture 8

36

### Built-in functions

- We’ve used many Matlab built-in functions, e.g., **rand**, **abs**, **floor**, **rem**
- Example: **abs(x-.5)**
- Observations:
  - **abs** is set up to be able to work with any valid data
  - **abs** *doesn’t prompt us for input; it expects that we provide data* that it’ll then work on

February 23, 2010

Lecture 9

37

### User-defined functions

- We can write our own functions to perform a specific task
  - **Example:** generate a random floating point number in a specified interval
  - **Example:** convert polar coordinates to x-y (Cartesian) coordinates

February 23, 2010

Lecture 9

38

### Draw a bulls eye figure with randomly placed dots

- What are the main tasks?
- Accommodate variable number of rings—loop
- For each ring
  - Need many dots
  - For each dot
    - Generate random position
    - Choose color
    - Draw it

February 23, 2010

Lecture 9

41

### Convert from polar to Cartesian coordinates

February 23, 2010

Lecture 9

42

```
c= input('How many concentric rings? ');
d= input('How many dots? ');

% Put dots btwn circles with radii rRing and (rRing-1)
for rRing= 1:c
    % Draw d dots
    for count= 1:d

        % Generate random dot location (polar coord.)
        theta= _____
        r= _____

        % Convert from polar to Cartesian
        x= _____
        y= _____

        % Use plot to draw dot
    end
end
```

A common task! Create a function `polar2xy` to do this. `polar2xy` likely will be useful in other problems as well.

February 23, 2010

Lecture 9

43

```
function [x, y] = polar2xy(r,theta)
% Convert polar coordinates (r,theta) to
% Cartesian coordinates (x,y).
% theta is in degrees.

rads= theta*pi/180; % radian
x= r*cos(rads);
y= r*sin(rads);
```

Think of `polar2xy` as a factory

```
function [x, y] = polar2xy(r,theta)
% Convert polar coordinates (r,theta) to
% Cartesian coordinates (x,y).
% theta is in degrees.
```

```
rads= theta*pi/180; % radian
x= r*cos(rads);
y= r*sin(rads);
```

A function file  
`polar2xy.m`

```
r= input('Enter radius: ');
theta= input('Enter angle in degrees: ');
```

```
rads= theta*pi/180; % radian
x= r*cos(rads);
y= r*sin(rads);
```

(Part of) a  
script file

```
function [x, y] = polar2xy(r,theta)
```

Output  
parameter list  
enclosed in [ ]

Function name  
(This file's name is  
`polar2xy.m`)

Input parameter  
list enclosed in  
( )

February 23, 2010

Lecture 9

51

Function header is the "contract" for how the function will be used (called)

You have this function:

```
function [x, y] = polar2xy(r, theta)
% Convert polar coordinates (r, theta) to
% Cartesian coordinates (x,y). Theta in degrees.
...
```

Code to call the above function:

```
% Convert polar (r1,t1) to Cartesian (x1,y1)
r1= 1; t1= 30;
[x1, y1]= polar2xy(r1, t1);
plot(x1, y1, 'b*')
...
```

February 23, 2010

Lecture 9

53

General form of a user-defined function

```
function [out1, out2, ...]= functionName (in1, in2, ...)
% 1-line comment to describe the function
% Additional description of function
```

Executable code that at some point assigns  
values to output parameters `out1, out2, ...`

- `in1, in2, ...` are defined when the function begins execution. Variables `in1, in2, ...` are called function *parameters* and they hold the function *arguments* used when the function is invoked (called).
- `out1, out2, ...` are not defined until the executable code in the function assigns values to them.
