Creating Links - In

To overwrite destination if it already exists.
-1 — overwrite destination if it already exists.
-s — create symbolic links instead of hard links.

Options:

In options, src1, src2, ... srcn with the same names as src or
In options, src1 ... srcn dst1 ... dstn — in directory create links pointing to
In options, src dst — create a link dst pointing to src.

Symbolic Links

Symbolic links point to a file, allowing you to change the file's location without affecting other files or directories. However, it is important to note that symbolic links do not actually move files. Instead, they create a reference to the file's original location.

Hard Links

Hard links act almost like separate copies of the file, but they point to the same physical location on the disk. Any changes made to one file will affect all hard links pointing to it.
