

## Introduction to Computer Programming Using Matlab

### A computer program

### What will be in our first example program (lab 1)?

- **Input**
  - Get trapezoid data from the user
  - Need b1, b2, h
- **Calculation**
  - Just use the formula to calculate (and store) the answer
- **Output**
  - Show the result on the screen
- **Comments**
  - "explanations" for humans; computer ignores comments.

### Input & output

- `variable = input( 'prompt' )`  
`h= input('Enter the height: ')`
- `fprintf( 'message to print' )`  
`fprintf('Hello!')`  
`fprintf('Area is %f\n', x)`

### Saving and running a program

- Matlab programs have the filename extension **.m**
- Eg., a Matlab program file may have the name

**trapezoidArea.m**

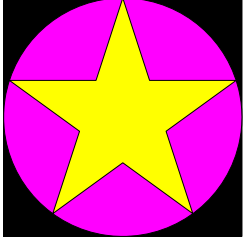

- To run a Matlab program with the above name, type in the Command Window the name without the .m extension

### Calling a built-in function

- You only need to know the name of the functions and how to use it
- E.g., to evaluate the sine of 2 radians you type **sin(2)**  
i.e., you call the function by its name and give it one single value to work on.
- To use the remainder function, e.g., **rem(315,7)**  
This function needs two values.

Play with graphics function

```
DrawRect(...)
DrawDisk(...)
DrawStar(...)
```

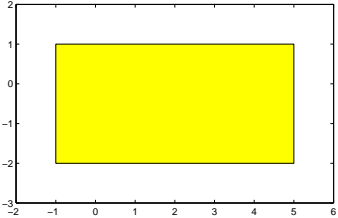

7

x and y coordinates of lower left corner      width      height

```
DrawRect(-1,-2,6,3,'y')
```

color

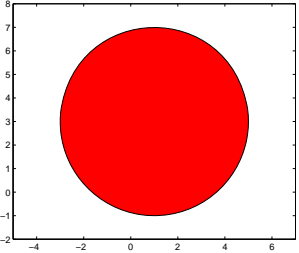

8

x and y coordinates of the center      radius

```
DrawDisk(1,3,4,'r')
```

color

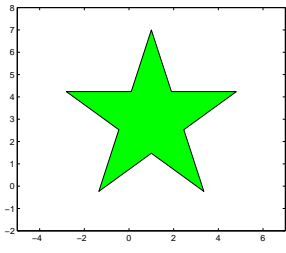

9

x and y coordinates of the center      "radius"

```
DrawStar(1,3,4,'g')
```

color

10

Color Options

White	'w'	
Black	'k'	
Red	'r'	
Blue	'b'	
Green	'g'	
Yellow	'y'	
Magenta	'm'	
Cyan	'c'	

11

A general graphics framework

```
% drawDemo
close all
figure
axis equal off
hold on
```

*Code fragment to draw the objects (rectangle, disk, star)*

```
hold off
```
