Announcements

- Project 1 out this Friday
- Go to section this week to find a partner!
- In general:
  - start the lab assignment before section
  - so you can ask questions on all parts
- Office hours next week: Tuesday 2-3pm
- Prelim 1 is Thursday, Feb. 28
Defining Functions
User-defined functions give names to blocks of code

def spread(values):
    return max(values) - min(values)
Discussion Question

What does this function do? What kind of input does it take? What output will it give? What's a reasonable name?

def f(s):
    return np.round(s / sum(s) * 100, 2)

(Demo)
Apply
Apply

The **apply** method creates an array by calling a function on every element in input column(s)

- **First argument:** Function to apply
- **Other arguments:** The input column(s)

```
  table_name.apply(function_name, 'column_label')
```

(Demo)
Example: Prediction
Sir Francis Galton

- 1822 - 1911 (knighted in 1909)
- A pioneer in making predictions
- Particular interest in heredity
- Charles Darwin's half-cousin
