

THREADS & CONCURRENCY

Lecture 22– CS2110 – Fall 2015

Announcements

Prelim 2 is next Thursday

Please complete P2Conflict by November 13!

Today: Start a new topic

- Modern computers have "multiple cores"
 Instead of a single CPU on the chip
 5-10 common. Intel has prototypes with 80!
- And even with a single core your program may have more than one thing "to do" at a time
 Argues for having a way to do many things at once

□ Finally, we often run many programs all at once

Why Multicore?

4

Moore's Law: Computer speeds and memory densities nearly double each year

But a fast computer runs hot

- Power dissipation rises as square of the clock rate
- Chips were heading towards melting down!
- Multicore: with four CPUs (cores) on one chip, even if we run each at half speed we can perform more overall computations!

Challenge

- The operating system provides support for multiple "processes"
- In reality there are usually fewer processors than processes
- Processes are an abstraction: at hardware level, lots of multitasking
 - memory subsystem
 - -video controller
 - -buses
 - instruction prefetching
- Virtualization allows a single machine to behave like many...

What is a Thread?

- A separate "execution" <u>that runs within a single</u> <u>program</u> and can perform a computational task independently and concurrently with other threads
- Many applications do their work in just a single thread: the one that called main() at startup
 - But there may still be extra threads...
 - I... Garbage collection runs in a "background" thread
 - GUIs have a separate thread that listens for events and "dispatches" upcalls
- Today: learn to create new threads of our own

What is a Thread?

- A thread is anobject that "independently computes"
 Needs to be created, like any object
 - Then "started" This causes some method (like main()) to be invoked. It runs side by side with other thread in the same program and they see the same global data
- The actual execution could occur on distinct CPU cores, but doesn't need to
 - We can also simulate threads by multiplexing a smaller number of cores over a larger number of threads

Concurrency

- 9
- Concurrency refers to a single program in which several threads are running simultaneously
 - Special problems arise
 - They see the same data and hence can interfere with each other, e.g. if one thread is modifying a complex structure like a heap while another is trying to read it
- □ In this course we will focus on two main issues:
 - Race conditions
 - Deadlock

Thread class in Java

- Threads are instances of the class Thread
 - Can create many, but they do consume space & time
 - The Java Virtual Machine creates the thread that executes your main method.
 - Threads have a priority
 - Higher priority threads are executed preferentially
 - By default, newly created Threads have initial priority equal to the thread that created it (but can change)

Creating a new Thread (Method 1)

Creating a new Thread (Method 2)

```
class PrimeRun implements Runnable {
  long a, b;
  PrimeRun(long a, long b) {
    this.a = a; this.b = b;
  }
  public void run() {
    //compute primes between a and b
    ...
  }
}
```

```
PrimeRun p = new PrimeRun(143, 195);
new Thread(p).start();
```

13

```
public class ThreadTest extends Thread {
   public static void main(String[] args) {
      new ThreadTest().start();
      for (int i = 0; i < 10; i++) {</pre>
         System.out.format("%s %d\n",
             Thread.currentThread(), i);
   public void run() {
      for (int i = 0; i < 10; i++) {</pre>
         System.out.format("%s %d\n",
            Thread.currentThread(), i);
      }
```

Thread[Thread-0,5,main] 0 Thread[main,5,main] 0 Thread[main, 5, main] 1 Thread[main, 5, main] 2 Thread[main, 5, main] 3 Thread[main, 5, main] 4 Thread[main, 5, main] 5 Thread[main,5,main] 6 Thread[main, 5, main] 7 Thread[main, 5, main] 8 Thread[main, 5, main] 9 Thread[Thread-0,5,main] 1 Thread[Thread-0,5,main] 2 Thread[Thread-0,5,main] 3 Thread[Thread-0,5,main] 4 Thread[Thread-0,5,main] 5 Thread[Thread-0,5,main] 6 Thread[Thread-0,5,main] 7 Thread[Thread-0,5,main] 8 Thread[Thread-0,5,main] 9

14

```
public class ThreadTest extends Thread {
   public static void main(String[] args) {
      new ThreadTest().start();
      for (int i = 0; i < 10; i++) {</pre>
         System.out.format("%s %d\n",
            Thread.currentThread(), i);
   public void run() {
      currentThread().setPriority(4);
      for (int i = 0; i < 10; i++) {</pre>
         System.out.format("%s %d\n",
            Thread.currentThread(), i);
```

Terminating Threads is tricky

Easily done... but only in certain ways

- The safe way to terminate a thread is to have it return from its run method
- If a thread throws an uncaught exception, whole program will be halted (but it can take a second or too...)
- There are some old APIs but they have issues: stop(), interrupt(), suspend(), destroy(), etc.
 - Issue: they can easily leave the application in a "broken" internal state.
 - Many applications have some kind of variable telling the thread to stop itself.

Threads can pause

- □ When active, a thread is "runnable".
- - It may not actually be "running". For that, a CPU must schedule it. Higher priority threads could run first.
- □ A thread can also pause
 - It can call Thread.sleep(k) to sleep for k milliseconds
 - If it tries to do "I/O" (e.g. read a file, wait for mouse input, even open a file) this can cause it to pause
 - Java has a form of locks associated with objects. When threads lock an object, one succeeds at a time.

Background (daemon) Threads

- In many applications we have a notion of "foreground" and "background" (daemon) threads
 Foreground threads are the ones doing visible work, like interacting with the user or updating the display
 Background threads do things like maintaining data
 - structures (rebalancing trees, garbage collection, etc)
- On your computer, the same notion of background workers explains why so many things are always running in the task manager.

Race Conditions

- A "race condition" arises if two or more threads access the same variables or objects concurrently and at least one does updates
- Example: Suppose t1 and t2 simulatenously execute the statement x = x + 1; for some static global x.
 Internally, this involves loading x, adding 1, storing x
 If t1 and t2 do this concurrently, we execute the statement twice, but x may only be incremented once
 - t1 and t2 "race" to do the update

Race Conditions

□ Suppose X is initially 5

Thread t1	Thread t2
□ ADD 1	□ ADD 1

□ ... after finishing, X=6! We "lost" an update

Race Conditions

- Race conditions are bad news
 - Sometimes you can make code behave correctly despite race conditions, but more often they cause bugs
 - And they can cause many kinds of bugs, not just the example we see here!
 - A common cause for "blue screens," null pointer exceptions, damaged data structures

Example – A Lucky Scenario

```
private Stack<String> stack = new Stack<String>();
public void doSomething() {
    if (stack.isEmpty()) return;
    String s = stack.pop();
    //do something with s...
}
```

Suppose threads A and B want to call **doSomething()**, and there is one element on the stack

1. thread A tests **stack**.isEmpty() false

- 2. thread A pops \Rightarrow stack is now empty
- 3. thread B tests **stack**.isEmpty() \Rightarrow true
- 4. thread B just returns nothing to do

Example – An Unlucky Scenario

```
private Stack<String> stack = new Stack<String>();
public void doSomething() {
    if (stack.isEmpty()) return;
    String s = stack.pop();
    //do something with s...
}
```

Suppose threads A and B want to call **doSomething()**, and there is one element on the stack

- 1. thread A tests **stack**.isEmpty() \Rightarrow false
- 2. thread B tests **stack.isEmpty()** \Rightarrow false
- 3. thread A pops \Rightarrow stack is now empty
- 4. thread B pops \Rightarrow Exception!

Synchronization

- Java has one "primary" tool for preventing these problems, and you must use it by carefully and explicitly – it isn't automatic.
 - Called a "synchronization barrier"
 - We think of it as a kind of lock
 - Even if several threads try to acquire the lock at once, only one can succeed at a time, while others wait
 - When it releases the lock, the next thread can acquire it
 - You can't predict the order in which contending threads will get the lock but it should be "fair" if priorities are the same

Solution – with synchronization

- Put critical operations in a synchronized block
- The stack object acts as a lock
- Only one thread can own the lock at a time

Solution – Locking

. . .

• You can lock on any object, including this

public synchronized void doSomething() {

Behaves like

Synchronization+priorities

- 28
- Combining mundane features can get you in trouble
- Java has priorities... and synchronization
 - But they don't "mix" nicely
 - High-priority runs before low priority
 - In the lower priority thread "starves"
- Even worse...

With many threads, you could have a second high priority thread stuck waiting on that starving low priority thread! Now <u>both</u> are starving...

Fancier forms of locking

- Java developers have created various synchronization ADTs
 Semaphores: a kind of synchronized counter
 Event-driven synchronization
- The Windows and Linux and Apple O/S all have kernel locking features, like file locking

But for Java, synchronized is the core mechanism

The downside of locking – deadlock

A deadlock occurs when two or more competing threads are waiting for one-another... forever

Example:

Thread t1 calls synchronized b inside synchronized a

But thread t2 calls synchronized a inside synchronized b

t1 waits for t2... and t2 waits for t1...

Finer grained synchronization

Java allows you to do fancier synchronization
 But can only be used <u>inside</u> a synchronization block
 Special primatives called wait/notify

wait/notify

32

Summary

- Use of multiple processes and multiple threads within each process can exploit concurrency
 - Which may be real (multicore) or "virtual" (an illusion)
- But when using threads, beware!
 - Must lock (synchronize) any shared memory to avoid nondeterminism and race conditions
 - Yet synchronization also creates risk of deadlocks
 - Even with proper locking concurrent programs can have other problems such as "livelock"
- Serious treatment of concurrency is a complex topic (covered in more detail in cs3410 and cs4410)
