Lecture 19

Character Behavior
Take Away for Today

- Review the *sense-think-act* cycle
  - How do we separate actions and thinking?
  - Delay the sensing problem to next time

- What is *rule-based* character AI?
  - How does it relate to sense-think-act?
  - What are its advantages and disadvantages?

- What *alternatives* are there to rule-based AI?
  - What is our motivation for using them?
  - How do they affect the game architecture?
Classical AI vs. Game AI

- **Classical**: Design of *intelligent agents*
  - Perceives environment, maximizes its success
  - Established area of computer science
  - Subtopics: planning, machine learning

- **Game**: Design of *rational behavior*
  - Does not need to optimize (and often will not)
  - Often about “scripting” a personality
  - More akin to cognitive science
Role of AI in Games

• **Autonomous Characters** (NPCs)
  • Mimics the “personality” of the character
  • May be opponent or support character

• **Strategic Opponents**
  • AI at the “player level”
  • Closest to classical AI

• **Character Dialog**
  • Intelligent commentary
  • Narrative management (e.g. Façade)
Role of AI in Games

- **Autonomous Characters** (NPCs)
  - Mimics the “personality” of the character
  - May be opponent or support character

- **Strategic Opponents**
  - AI at the “player level”
  - Closest to classical AI

- **Character Dialog**
  - Intelligent commentary
  - Narrative management (e.g. Façade)
Review: Sense-Think-Act

- **Sense:**
  - Perceive the world
  - Reading the game state
  - **Example:** enemy near?

- **Think:**
  - Choose an action
  - Often merged with sense
  - **Example:** fight or flee

- **Act:**
  - Update the state
  - Simple and fast
  - **Example:** reduce health
S-T-A: Separation of Logic

- **Loops** = sensing
  - Read other objects
  - *Aggregate* for thinking
  - **Example**: nearest enemy

- **Conditionals** = thinking
  - Use results of sensing
  - Switch between possibilities
  - **Example**: attack or flee

- **Assignments** = actions
  - Rarely need loops
  - Avoid conditionals

```java
move(int direction) {
    switch (direction) {
    case NORTH:
        y -= 1;
        break;
    case EAST:
        x += 1;
        break;
    case SOUTH:
        y += 1;
        break;
    case WEST:
        x -= 1;
        break;
    } }```

Character Behavior
S-T-A: Separation of Logic

- **Loops** = sensing
  - Read other objects
  - *Aggregate* for thinking
  - **Example**: nearest enemy

- **Conditionals** = thinking
  - Use results of sensing
  - Switch between possibilities
  - **Example**: attack or flee

- **Assignments** = actions
  - Rarely need loops
  - Avoid conditionals

```java
move(int direction) {
    switch (direction) {
    case NORTH:
        y -= 1;
        break;
    case EAST:
        x += 1;
        break;
    case SOUTH:
        y += 1;
        break;
    case WEST:
        x -= 1;
        break;
    }
}
```
S-T-A: Separation of Logic

- **Loops** = sensing
  - Read other objects
  - *Aggregate* for thinking
  - **Example**: nearest enemy

- **Conditionals** = thinking
  - Use results of sensing
  - Switch between possibilities
  - **Example**: attack or flee

- **Assignments** = actions
  - Rarely need loops
  - Avoid conditionals

```java
move(int direction) {
    switch (direction) {
    case NORTH:
        y -= 1;
        break;
    case EAST:
        x += 1;
        break;
    case SOUTH:
        y += 1;
        break;
    case WEST:
        x -= 1;
        break;
    }
}
```

```java
move(int dx, int dy) {
    x += dx;
    y += dy;
}
```
S-T-A: Reducing Dependencies

- Actor1 Controller
- GameState
- Actor1

- Actor2 Controller

Review: Sense-Think-Act

- **Sense:**
  - Perceive the world
  - Reading the game state
  - **Example:** enemy near?

- **Think:**
  - Choose an action
  - Often merged with sense
  - **Example:** fight or flee

- **Act:**
  - Update the state
  - Simple and fast
  - **Example:** reduce health
Actions: Short and Simple

- Mainly use **assignments**
  - Avoid loops, conditionals
  - Similar to getters/setters
  - Complex code in **thinking**
- Helps with **serializability**
  - Record and undo actions
- Helps with **networking**
  - Keep doing last action
  - Recall: *dead reckoning*

```java
move(int direction) {
    switch (direction) {
    case NORTH:
        y -= 1;
        break;
    case EAST:
        x += 1;
        break;
    case SOUTH:
        y += 1;
        break;
    case WEST:
        x -= 1;
        break;
    }
}
```

```java
move(int dx, int dy) {
    x += dx;
    y += dy;
}
```

```java
case WEST:
    x = 1;
    break;
```
Delaying Actions

Sequential Actions are Bad

NPC 1

NPC 2

NPC 3

NPC 4

Think (Choose) & Act (Apply)

Choose Action; Apply Later

NPC 1

NPC 2

NPC 1

NPC 2

Think (Choose)

Act (Apply)

Character Behavior
Thinking: Primary Challenge

- A mess of conditionals
  - “Spaghetti” code
  - Difficult to modify

- Abstraction requirements:
  - Easy to visualize models
  - Mirror “cognitive thought”

- Want to separate talent
  - **Sensing:** Programmers
  - **Thinking:** Designers
  - **Actions:** Programmers

```c
if (sense_1) {
    if (sense_{11}) { ...
    } else if (sense_{12}) { ...
    } else if (sense_{13}) { ...
    } else {...
}
else if (sense_2) {
    if (sense_{21}) { ...
    } else if (sense_{22}) { ...
    } else {...
}
else if (sense_3) { ...
}
```
Thinking: Primary Challenge

- A mess of conditionals
  - “Spaghetti” code
  - Difficult to modify
- Abstraction requirements:
  - Easy to visualize models
  - Mirror “cognitive thought”
- Want to separate talent
  - Sensing: Programmers
  - Thinking: Designers
  - Actions: Programmers

```java
if (sense1) {
    if (sense11) { ... }
    else if (sense12) { ... }
    else if (sense13) { ... } else { ... }
}
else if (sense2) {
    if (sense21) { ... } else if (sense22) { ... }
    else { ... }
    else if (sense3) { ... }
}
```
Rule-Based AI

If $X$ is true, Then do $Y$

Three-Step Process

- **Match**
  - For each rule, check if
  - Return *all* matches

- **Resolve**
  - Can only use one rule
  - Use metarule to pick one

- **Act**
  - Do *then*-part
Rule-Based AI

If $X$ is true, Then do $Y$

- **Thinking**: Providing a list of several rules
  - But what happens if there is more than one rule?
  - Which rule do we choose?
Rule-Based AI

If $X$ is true, Then do $Y$

- **Thinking**: Providing a list of several rules
  - But what happens if there is more than one rule?
  - Which rule do we choose?
Simplicity of Rule-Based AI
Conflict Resolution

- Often **resolve by order**
  - Each rule has a priority
  - Higher priorities go first
  - “Flattening” conditionals

- **Problems:**
  - **Predictable**
    Same events = same rules
  - **Total order**
    Sometimes no preference
  - **Performance**
    On average, go far down list

- **Rules**:
  - \( R_1: \text{if } \text{event}_1 \text{ then } \text{act}_1 \)
  - \( R_2: \text{if } \text{event}_2 \text{ then } \text{act}_2 \)
  - \( R_3: \text{if } \text{event}_3 \text{ then } \text{act}_3 \)
  - \( R_4: \text{if } \text{event}_4 \text{ then } \text{act}_4 \)
  - \( R_5: \text{if } \text{event}_5 \text{ then } \text{act}_5 \)
  - \( R_6: \text{if } \text{event}_6 \text{ then } \text{act}_6 \)
  - \( R_7: \text{if } \text{event}_7 \text{ then } \text{act}_7 \)
Conflict Resolution

- **Specificity:**
  - Rule w/ most “components”

- **Random:**
  - Select randomly from list
  - May “weight” probabilities

- **Refractory Inhibition:**
  - Do not repeat recent rule
  - Can combine with ordering

- **Data Recency:**
  - Select most recent update

\[ \begin{align*}
R_1: & \text{ if } A, B, C, \text{ then } \\
R_2: & \text{ if } A, B, D, \text{ then }
\end{align*} \]
Impulses

- Correspond to certain events
  - **Global**: not tied to NPC
  - Must also have duration
- Used to reorder rules
  - Event makes rule important
  - Temporarily up the priority
  - Restore when event is over
- Preferred conflict resolution
  - Simple but flexible
  - Used in *Halo 3* AI.

\[
\begin{align*}
R_1 : & \text{if } \text{event}_1 \text{ then } \text{act}_1 \\
R_2 : & \text{if } \text{event}_2 \text{ then } \text{act}_2 \\
R_3 : & \text{if } \text{event}_3 \text{ then } \text{act}_3 \\
R_4 : & \text{if } \text{event}_4 \text{ then } \text{act}_4 \\
R_5 : & \text{if } \text{event}_5 \text{ then } \text{act}_5 \\
R_6 : & \text{if } \text{event}_6 \text{ then } \text{act}_6 \\
R_7 : & \text{if } \text{event}_7 \text{ then } \text{act}_7
\end{align*}
\]
Impulses

- Correspond to certain events
  - **Global**: not tied to NPC
  - Must also have duration
- Used to reorder rules
  - Event makes rule important
  - Temporarily up the priority
  - Restore when event is over
- Preferred conflict resolution
  - Simple but flexible
  - Used in *Halo 3* AI.

R₁: if event₁ then act₁
R₂: if event₂ then act₂
R₅: if event₅ then act₅
R₃: if event₃ then act₃
R₄: if event₄ then act₄
R₆: if event₆ then act₆
R₇: if event₇ then act₇
Rule-Based AI: Performance

- Matching = **sensing**
  - If-part is expensive
  - Test *every* condition
  - Many unmatched rules

- Improving performance
  - Optimize sensing (make if-part cheap)
  - Limit number of rules
  - Other solutions?

- Most games limit rules
  - Reason for *state machines*

---

Diagram:
- **Match**
  - Updated State
  - Matching Rules
- **Act**
  - Selected Rule
- **Resolve Conflicts**
Rule-Based AI: Performance

- Matching = **sensing**
  - If-part is expensive
  - Test *every* condition
  - Many unmatched rules

- Improving performance
  - Optimize sensing (make if-part cheap)
  - Limit number of rules
  - Other solutions?

- Most games limit rules
  - Reason for *state machines*

- 90-95% of time
  - Updated State
  - Matching Rules
  - Resolve Conflicts
  - Selected Rule
  - Act
Making the Rules Manageable

Character Behavior
Making the Rules Manageable

Limited number of rules per page

Switching page is an action
Finite State Machines

Events
- E=Enemy Seen
- S=Sound Heard
- D=Die

Slide courtesy of John Laird
Finite State Machines

**Events**
- E = Enemy Seen
- S = Sound Heard
- D = Die

Only check rules for *outgoing* edges

Slide courtesy of John Laird
Games have **thin** models
- Methods = get/set/update
- Controllers are heavyweight

**AI is a** controller
- Uniform process over NPCs

But behavior is **personal**
- Diff. NPCs = diff. behavior
- Do not want unique code

**What can we do?**
- Data-Driven Design

---

**Implementation: Model-View-Controller**

**Model**
- Manages the data
- Reacts to requests

**Controller**
- Updates model
- Updates view

**View**
- Displays model
- Provides interface
Implementation: Model-View-Controller

- **Actions** go in the model
  - Lightweight updates
  - Specific to model or role

- Controller is framework for general **sensing, thinking**
  - Standard FSM engine
  - Or FSM alternatives (later)

- **Process** stored in a model
  - Represent thinking as **graph**
  - Controller processes graph

Controller is framework for general **sensing, thinking**
An Aside: Animations

- AI may need many actions
  - Run, jump, duck, slide
  - Fire weapons, cast spells
  - Fidget while idling

- Want animations for all
  - Is loop appropriate for each?
  - How do we transition?

- **Idea**: shared boundaries
  - End of loop = start of another
  - Treat like advancing a frame

Landing Animation

Idling Animation
An Aside: Animations

- AI may need many actions
  - Run, jump, duck, slide
  - Fire weapons, cast spells
  - Fidget while idling

- Want animations for all
  - Is loop appropriate for each?
  - How do we transition?

- **Idea**: shared boundaries
  - End of loop = start of another
  - Treat like advancing a frame
An Aside: Animations

- AI may need many actions
  - Run, jump, duck, slide
  - Fire weapons, cast spells
  - Fidget while idling

- Want animations for all
  - Is loop appropriate for each?
  - How do we transition?

- Idea: shared boundaries
  - End of loop = start of another
  - Treat like advancing a frame
Animation and State Machines

- **Idea**: Each sequence a state
  - Do sequence while in state
  - Transition when at end
  - Only loop if loop in graph

- A graph edge means...
  - Boundaries match up
  - Transition is allowable

- Similar to data driven AI
  - Created by the designer
  - Implemented by programmer
  - Modern engines have tools
• **Idea:** Each sequence a state
  - Do sequence while in state
  - Transition when at end
  - Only loop if loop in graph

• A graph edge means…
  - Boundaries match up
  - Transition is allowable

• Similar to data driven AI
  - Created by the designer
  - Implemented by programmer
  - Modern engines have tools
Complex Example: Jumping

- **Stand**
- **Stand2Crouch**
  - **Crouch**
  - **Takeoff**
  - **Hop**
  - **Float**
- **Land**
Complex Example: Jumping

- Stand
- Jump Press
- Stand2Crouch
- Jump Release
- Crouch
- Near Ground
- Jump Release
- Takeoff
- Hop
- Float
- Land
Complex Example: Jumping

Transition state needed to align the sequences

Graph representation:
- Stand
- Stand2crouch
- Crouch
- Hop
- Takeoff
- Float
- Land

Character Behavior
## LibGDX Interfaces

### StateMachine\(<E>\>

- Attached to an entity
  - Set the entity in constructor
  - New entity, new state machine
- Must implement methods
  - `update()`
  - `changeState(State<A> state)`
  - `revertToPreviousState()`
  - `getCurrentState()`
  - `isInState(State<A> state)`
- `DefaultStateMachine` provided

### State\(<E>\>

- Not attached to an entity
  - StateMachine sets state
  - StateMachine passes entity
- Must implement methods
  - `enter(E entity)`
    When machine enters state
  - `exit(E entity)`
    When machine enters state
  - `update(E entity)`
    When machine stays in state
LibGDX Interfaces

StateMachine<E>

- Attached to an entity
- Constructor sets state machine
- Must implement methods
  - update()
  - changeState(State<A> state)
  - revertToPreviousState()
  - getCurrentState()
  - isInState(State<A> state)
- DefaultStateMachine provided

State<E>

- Not attached to an entity
- StateMachine sets state
- StateMachine passes entity
- Must implement methods
  - enter(E entity)
    - When machine enters state
  - exit(E entity)
    - When machine enters state
  - update(E entity)
    - When machine stays in state

Updates current state. Does not transition!

Transition logic external to the state machine.
Problems with FSMs

Events
- E=Enemy Seen
- S=Sound Heard
- D=Die

No edge from Attack to Chase

Slide courtesy of John Laird

Character Behavior
Problems with FSMs

Events
- E=Enemy Seen
- S=Sound Heard
- D=Die

Requires a redundant state

Slide courtesy of John Laird
Problems with FSMs

Events
- E = Enemy Seen
- S = Sound Heard
- D = Die
- L = Low Health

Adding a new feature can double states

Slide courtesy of John Laird
Problems with FSMs

Events
- E = Enemy Seen
- S = Sound Heard
- D = Die
- L = Low Health

Adding a new feature can double states

Might as Well Go Back to Rule Based AI

Slide courtesy of John Laird
An Observation

• Each state has a set of global attributes
  • Different attributes may have same actions
  • Reason for redundant behavior

• Currently just cared about attributes
  • Not really using the full power of a FSM
  • Why don’t we just check attributes directly?

• Attribute-based selection: decision trees
Decision Trees

• Thinking **encoded as a tree**
  • Attributes = tree nodes
  • Left = true, right = false
  • Actions = leaves (reach from the root)

• Classify by **descending** from root to a leaf
  • Start with the test at the root
  • Descend the branch according to the test
  • Repeat until a leaf is reached
Decision Tree Example

Start Here

D?

D? t  t  f  f

Spawn  Retreat  Attack  L?  Wander

L?  L?  S?  S?

Retreat  Retreat  Chase

Action

Slide courtesy of John Laird
Decision Tree Example

Slide courtesy of John Laird
FSMs vs. Decision Trees

**Finite State Machines**
- Not limited to attributes
- Allow “arbitrary” behavior
- Explode in size very fast

**Decision Trees**
- Only attribute selection
- Much more manageable
- Mixes w/ machine learning

---

**Character Behavior**
Behavior Trees

- Part rule-based
- Part decision tree
- Freedom of FSM (almost)

- Node is a list of *actions*
- Select action using *rules*
- Action leads to *subactions*
Behavior Trees

Ordered Rules → Retreat, Engage, Idle → Ordered Rules with Actions

Rule Outcome → Flee, Hide → Act

Rule Outcome → Shoot, Charge, Grenade → Act

Rule Outcome → Wander, Guard → Act
Behavior Trees

Ordered Rules

Root

Act

Ordered Rules with Actions

Impulses Reorder

Retreat Engage Idle

Shoot Charge Grenade Wander Guard

Flee Hide

Rule Outcome

Character Behavior
LibGDX Behavior Trees

- Base actions are defined at the leaves
- Internal nodes to **select** or even **combine** tasks
LibGDX Behavior Trees

- Base actions are defined at the leaves
- Internal nodes to **select** or even **combine** tasks

Use classes in LibGDX
(sub)Classes you create

Can be either condition (if) or an action (then)
LibGDX Rules

- **Selector** rules
  - Tests each subtask for success
  - Tasks are tried independently
  - Chooses first one to succeed

- **Sequence** rules
  - Tests each subtask for success
  - Tasks are tried in order
  - Does all if succeeds; else none

- **Parallel** rules
  - Tests each subtask for success
  - Tasks are tried simultaneously
  - Does all if succeeds; else none
Decorator Rules

- Rules with a single child
  - Wrap subtree as single task
  - Modify the meaning of task

- Example decorators
  - AlwaysFail
  - AlwaysSucceed
  - Invert (do the opposite)
  - Limit (# of times to do)

- Supports dynamic sequences
  - UntilFail (repeat until fail)
  - UntilSuccess
Summary

- Character AI is a **software engineering** problem
  - Sense-think-act aids code reuse and ease of design
  - Least standardized aspect of game architecture

- **Rule-based AI** is the foundation for all character AI
  - Simplified variation of sense-think-act
  - Alternative systems made to limit number of rules

- Games use **graphical models** for data-driven AI
  - Controller outside of NPC model processes AI
  - Graph stored in NPC model tailors AI to individuals
