Lecture 8

Prototyping
What is a Prototype?

- An *incomplete* model of your product
  - Implements small subset of the final features
  - Features chosen are the most important **now**
- Prototype helps you visualize **gameplay**
  - Way for you to test a new game mechanic
  - Allows you to tune mechanic parameters
  - Can also test (some) user interfaces
What is a Prototype?

• A prototype helps you visualize **subsystems**
  • Custom lighting algorithms
  • Custom physics engine
  • Network communication layer

• Fits naturally with the SCRUM sprint
  • Identify the core mechanic/subsystem to test
  • Develop subsystem separately in sprint
  • If successful, integrate into main code
Types of Prototypes

- **Throwaway prototyping**
  - Prototype will be discarded after use
  - Often created with middleware/prototyping tool
  - Useful for **gameplay prototype**

- **Evolutionary Prototyping**
  - Robust prototype that is refined over time
  - Code eventually integrated into final product
  - Useful for your **technical prototype**
Case Study: Playing Fields

- Computer map aid for playing D&D
  - Provides a map grid for moving tokens about
  - Tools for creating tokens and images
  - Network support for a DM with many players
  - Intelligently obscures player visibility

- **Motivation**: lessen player “metagaming”
  - Physical map displays too much information
  - Playing over a network is a secondary concern

Prototyping
Case Study: Playing Fields

Prototyping
Gameplay Prototypes

- Focus on core mechanic (e.g. verb/interaction)
  - May want more than one for emergent behavior
  - But no more than 2 or 3 mechanics
  - Keep challenges very, very simple

- Prototype should allow *tuning on the fly*
  - Requiring a recompile to tune is inefficient
  - Use menus/input fields/keyboard commands
  - But do not make the UI too complicated either
Prototyping Playing Fields

- What are the core mechanics?
  - Moving a token about a grid
  - Using obstacles to block visibility

- Focuses on **visibility** and **user control**
  - Use a single token with fixed obstructions
  - Do not support network play
  - Do not worry about invalid moves

- Visibility distance is a **tunable** parameter
Playing Fields Prototype
Prototype: Lessons Learned

• Algorithm makes it difficult to see walls
  • May want unseen area a color other than black
  • May want to “fudge the edge of the boundary”

• Update algorithm does not support “strafing”
  • Vision is updated at start and beginning of move
  • Nothing “in between” is counted (e.g. alleys)

• Spacing of 50 pixels is optimal for viewing
Technical Prototyping

- Technical prototypes used for *subsystems*
  - Custom lighting algorithms
  - Custom physics engine
  - Network communication layer

- **Goal**: inspect inner workings of software
  - Features might be “invisible” in normal game
  - Specialized interface to visualize process

- **Not-a-Goal**: Make something fun
Case Study: Shadows and Lighting

- Recall gameplay prototype
  - Discrete shadows are easy
  - But had many problems
- Want something more robust
  - Continuously movement
  - Curved wall edges
  - Self-intersecting shadows
- Different features to test
  - Moving an avatar
  - Reconfiguring the wall
Case Study: Shadows and Lighting

- Recall gameplay prototype
  - Discrete shadows are easy
  - But had many problems

- Want something more robust
  - Continuously movement
  - Curved wall edges
  - Self-intersecting shadows

- Different features to test
  - Moving an avatar
  - Reconfiguring the wall
Case Study: Shadows and Lighting
Case Study: Agent Movement

- Artificial potential fields
  - Obstacles are repulsive charge
  - Goal is an attractive charge
  - Sum together to get velocity
- Fast real-time movement
  - No hard AI algorithms
  - But has other problems…
- Will cover later in class
  - See *Pathfinding* in schedule
Case Study: Agent Movement

Instructions: To create a new vehicle, Control-click on its desired position. Use a regular click to select an existing vehicle for editing. A selected vehicle is indicated by a heavier border.

Only one vehicle may be selected at a time. A selected vehicle is pinned and will not move, but will still exert a force for avoidance.
Make subsystem robust (evolutionary prototype)

Support controls to change parameters on fly

Make interface simple (throwaway prototype)
Case Study: Forgotten Sky

The companion cube likes you, too.
Nondigital Prototypes
# Digital or Nondigital?

<table>
<thead>

<tr>
<td>Shuts out non-programmers</td>
<td>Input and player control</td>
</tr>
<tr>
<td>Longer development time</td>
<td>Complex systems</td>
</tr>
</tbody>
</table>
Lessons From Nondigital Prototypes

• Evaluate emergent behavior
  • Allow player to commit simultaneous actions
  • Model interactions as “board elements”

• Model player cost-benefit analyses
  • Model all resources with sources and sinks
  • Focus on economic dilemma challenges

• Early user testing for player difficulty
  • Ideal for puzzle games (or puzzle element)
  • Can also evaluate unusual interfaces
Prototypes in this Class

- Required to demo three prototypes in class
  - **Nondigital prototype** week from Wednesday
  - **Gameplay prototype** on March 5th
  - **Technical prototype** on March 19th

- Nondigital prototype may be trickiest
  - Keep it simple; avoid a full game
  - Focus on dilemma challenges (e.g. choice)
  - More details in the next lecture
The Gameplay Prototype

- **Throw-away prototype**
  - Does not have to be in Java
  - Can use another language (e.g. C#)
  - Can use authoring tools (e.g. Flash, Unity)

- **Goal**: demonstrate gameplay
  - Challenges impossible in nondigital prototype
  - Basic player controls and interface
  - Primary game mechanic
The Technical Prototype

- **Evolutionary prototype**
  - Should be written in Java and LibGDX
  - Most of the code will be reused later
  - Some of code (e.g. interface) can be thrown away

- **Goal**: visualization and tuning
  - Simple interface displaying core functionality
  - Controls (e.g. sliders, console) to change parameters
  - Playtest to figure proper setting of parameters
