Lecture 8

Prototyping
What is a Prototype?

- An *incomplete* model of your product
  - Implements small subset of the final features
  - Features chosen are the most important **now**

- Prototype helps you visualize **gameplay**
  - Way for you to test a new game mechanic
  - Allows you to tune mechanic parameters
  - Can also test (some) user interfaces
What is a Prototype?

- A prototype helps you visualize **subsystems**
  - Custom lighting algorithms
  - Custom physics engine
  - Network communication layer

- Fits naturally with the SCRUM sprint
  - Identify the core mechanic/subsystem to test
  - Develop subsystem separately in sprint
  - If successful, integrate into main code
Types of Prototypes

- **Throwaway prototyping**
  - Prototype will be discarded after use
  - Often created with middleware/prototyping tool
  - Useful for *gameplay prototype*

- **Evolutionary Prototyping**
  - Robust prototype that is refined over time
  - Code eventually integrated into final product
  - Useful for your *technical prototype*
Case Study: Playing Fields

- Computer map aid for playing D&D
  - Provides a map grid for moving tokens about
  - Tools for creating tokens and images
  - Network support for a DM with many players
  - Intelligently obscures player visibility

- Motivation: lessen player “metagaming”
  - Physical map displays too much information
  - Playing over a network is a secondary concern
Case Study: Playing Fields

Prototyping
Gameplay Prototypes

- Focus on core mechanic (e.g. verb/interaction)
  - May want more than one for emergent behavior
  - But no more than 2 or 3 mechanics
  - Keep challenges very, very simple

- Prototype should allow \textit{tuning on the fly}
  - Requiring a recompile to tune is inefficient
  - Use menus/input fields/keyboard commands
  - But do not make the UI too complicated either
Prototyping Playing Fields

- What are the core mechanics?
  - Moving a token about a grid
  - Using obstacles to block visibility

- Focuses on **visibility** and **user control**
  - Use a single token with fixed obstructions
  - Do not support network play
  - Do not worry about invalid moves

- Visibility distance is a *tunable* parameter
Playing Fields Prototype
Prototype: Lessons Learned

- Algorithm makes it difficult to see walls
  - May want unseen area a color other than black
  - May want to “fudge the edge of the boundary”
- Update algorithm does not support “strafing”
  - Vision is updated at start and beginning of move
  - Nothing “in between” is counted (e.g. alleys)
- Spacing of 50 pixels is optimal for viewing
3152 Example: Mount Sputnick
3152 Example: Mount Sputnick
Technical Prototyping

• Technical prototypes used for *subsystems*
  • Custom lighting algorithms
  • Custom physics engine
  • Network communication layer

• **Goal**: inspect inner workings of software
  • Features might be “invisible” in normal game
  • Specialized interface to visualize process

• **Not-a-Goal**: Make something fun
Case Study: Shadows and Lighting

- Recall gameplay prototype
  - Discrete shadows are easy
  - But had many problems

- Want something more robust
  - Continuously movement
  - Curved wall edges
  - Self-intersecting shadows

- Different features to test
  - Moving an avatar
  - Reconfiguring the wall
Case Study: Shadows and Lighting

- Recall gameplay prototype
  - Discrete shadows are easy
  - But had many problems

- Want something more robust
  - Continuously movement
  - Curved wall edges
  - Self-intersecting shadows

- Different features to test
  - Moving an avatar
  - Reconfiguring the wall
Case Study: Shadows and Lighting
Case Study: Agent Movement

- Artificial potential fields
  - Obstacles are repulsive charge
  - Goal is an attractive charge
  - Sum together to get velocity
- Fast real-time movement
  - No hard AI algorithms
  - But has other problems…
- Will cover later in class
  - See *Pathfinding* in schedule
Case Study: Agent Movement

Prototyping
Case Study: Agent Movement

Make subsystem robust
(evolutionary prototype)

Support controls to change parameters on fly

Make interface simple
(throwaway prototype)
3152 Example: *Forgotten Sky*
3152 Example: *Aiden*
3152 Example: Aiden

Prototype

Spirit Mode Off

<tr>
<td>• Shuts out non-programmers</td>
<td>• Input and player control</td>
</tr>
<tr>
<td>• Longer development time</td>
<td>• Complex systems</td>
</tr>
</tbody>
</table>
Lessons From Nondigital Prototypes

- **Evaluate emergent behavior**
  - Allow player to commit simultaneous actions
  - Model interactions as “board elements”

- **Model player cost-benefit analyses**
  - Model all resources with sources and sinks
  - Focus on economic dilemma challenges

- **Early user testing for player difficulty**
  - Ideal for puzzle games (or puzzle element)
  - Can also evaluate unusual interfaces
Prototypes in this Class

• Required to demo three prototypes in class
  • **Nondigital prototype** week from Wednesday
  • **Gameplay prototype** on March 2nd
  • **Technical prototype** on March 17th

• Nondigital prototype may be trickiest
  • Keep it simple; avoid a full game
  • Focus on dilemma challenges (e.g. choice)
  • More details in the next lecture
The Gameplay Prototype

• **Throw-away prototype**
  - Does not have to be in Java
  - Can use another language (e.g. C#)
  - Can use authoring tools (e.g. Flash, Unity)

• **Goal**: demonstrate gameplay
  - Challenges impossible in nondigital prototype
  - Basic player controls and interface
  - Primary game mechanic
The Technical Prototype

- **Evolutionary prototype**
  - Should be written in Java and LibGDX
  - Most of the code will be reused later
  - Some of code (e.g. interface) can be thrown away

- **Goal**: visualization and tuning
  - Simple interface displaying core functionality
  - Controls (e.g. sliders, console) to change parameters
  - Playtest to figure proper setting of parameters
