Lecture 24

Game Audio

The Role of Audio in Games

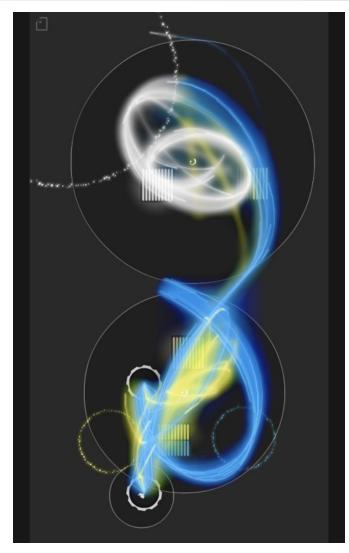

Engagement

- Entertains the player
 - Music/Soundtrack
- Enhances the **realism**
 - Sound effects
- Establishes **atmosphere**
 - Ambient sounds
- Other reasons?

The Role of Audio in Games

Feedback

- Indicate off-screen action
 - Indicate player should move
- Highlight on-screen action
 - Call attention to an NPC
- Increase **reaction** time
 - Players react to sound faster
- Other reasons?

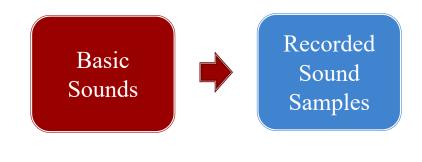

- Arcade games
- Early handhelds
- Early consoles

Early Sounds: Wizard of Wor

- Arcade games
- Early handhelds
- Early consoles

- Starts w/ MIDI
- 5th generation
- (Playstation)
- Early PCs

Sample = pre-recorded audio

Samples: Sinistar

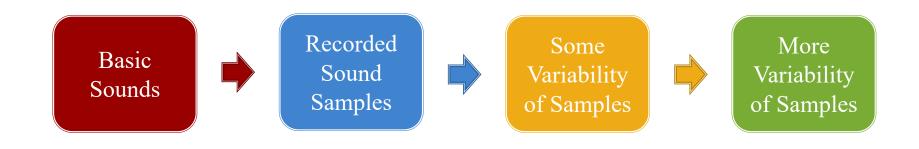

- Arcade games
- Early handhelds
- Early consoles

- Starts w/ MIDI
- 5th generation
- (Playstation)
- Early PCs

- Sample selection
- Volume
- Pitch
- Stereo pan

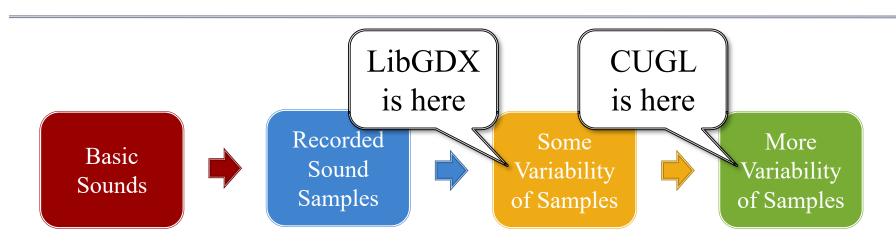

- Arcade games
- Early handhelds
- Early consoles

- Starts w/ MIDI
- 5th generation
- (Playstation)
- Early PCs

- Sample selection
- Volume
- Pitch
- Stereo pan

- Multiple samples
- Reverb models
- Sound filters
- Surround sound

- Arcade games
- Early handhelds
- Early consoles

- Starts w/ MIDI
- 5th generation
- (Playstation)
- Early PCs

- Sample selection
- Volume
- Pitch
- Stereo pan

- Multiple samples
- Reverb models
- Sound filters
- Surround sound

The Technical Challenges

- Sound **formats** are not (really) cross-platform
 - It is not as easy as choosing MP3
 - Different platforms favor different formats
- Sound playback **APIs** are not standardized
 - LibGDX & CUGL are layered over many APIs
 - Behavior is not the same on all platforms
- Sound playback crosses frame boundaries
 Mixing sound with animation has challenges

File Format vs Data Format

File Format

- The data storage format
 - Has data other than audio
- Many have many encodings
 - .caf holds MP3 and PCM

• Examples:

- .mp3, .wav, .aiff
- .aac, .mp4, .m4a (Apple)
- .flac, .ogg (Linux)

Data Format

- The actual audio encoding
 - Basic audio codec
 - Bit rate (# of bits/unit time)
 - Sample rate (digitizes an analog signal)
- Examples:
 - MP3, Linear PCM
 - AAC, HE-AAC, ALAC
 - FLAC, Vorbis

Game Audio Formats

Format	Description	File Formats				
Linear PCM	Completely uncompressed sound	.wav, .aiff				
MP3	A popular compressed, lossy codec	.mp3, .wav				
Vorbis	Xiph.org's alternative to MP3	.0gg				
FLAC	Xiph.org's compressed, lossless codec	.flac, .ogg				
MIDI	NOT SOUND ; Data for an instrument	.midi				
(HE-)AAC	A lossy codec, Apple's MP3 alternative	.aac, .mp4, .m4a				
ALAC	Apple's lossless codec (but compressed)	.alac, .mp4, .m4a				

MP3 historically avoided due to patent issues

Game Audio Formats

Format	Description	File Formats				
Linear PCM	Completely uncompressed sound	.wav, .aiff				
MP3	A por Supported in LibGDX	.mp3, .wav				
Vorbis	X ^j ph.org s alternative to MF3	.0gg				
FLAC	Xiph.org's compressed, lossless codec	.flac, .ogg				
MIDI	NOT SOUND ; Data for an instrument	.midi				
(HE-)AAC	A lossy codec, Apple's MP3 alternative	.aac, .mp4, .m4a				
ALAC	Apple's lossless codec (but compressed)	.alac, .mp4, .m4a				

MP3 historically avoided due to patent issues

Game Audio Formats

Format	Description	File Formats				
Linear PCM	Completely uncompressed sound	.wav, .aiff				
MP3	A por	.mp3, .wav				
Vorbis	Xiph. Supported in CUGL	.0gg				
FLAC	Xiph.org's compressed, lossless codec	.flac, .ogg				
MIDI	NOT SOUND ; Data for an instrument	.midi				
(HE-)AAC	A lossy codec, Apple's MP3 alternative	.aac, .mp4, .m4a				
ALAC	Apple's lossless codec (but compressed)	.alac, .mp4, .m4a				

MP3 historically avoided due to patent issues

Which Formats Should You Choose?

- **Question 1:** Streaming or no streaming?
 - Audio gets large fast; music often streamed
 - But streaming creates overhead; bad for sound fx
 - Few engines support WAV streams (LibGDX & CUGL do)
- **Question 2:** Lossy or lossless compression?
 - Music can by lossy; sound fx not so much
 - Only FLAC and WAV are standard lossless
- **Question 3:** How many channels (speakers) needed?
 - MP3 channel is *stereo only*
 - Others support many channels (e.g. 7.1 surround)

Which Formats Should You Choose?

• **Question 1:** Streaming or no streaming?

• Audio gets large fast; music often streamed

• **Question 3:** How many channels (speakers) needed?

- MP3 channel is *stereo only*
- Others support many channels (e.g. 7.1 surround)

• Sound data is an array of **sample** values

• A sample is an **amplitude** of a sound wave

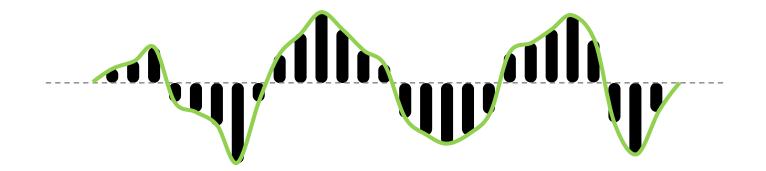

• Values are normalized -1.0 to 1.0 (so they are floats)

• Sound data is an array of **sample** values

0.5	0.2	-0.1	0.3	-0.5	0.0	-0.2	-0.2	0.0	-0.6	0.2	-0.3	0.4	0.0	
-----	-----	------	-----	------	-----	------	------	-----	------	-----	------	-----	-----	--

• A sample is an **amplitude** of a sound wave

• Sometimes encoded as shorts or bytes MIN to MAX

Sound data is an array of sample values

0.5 0.2 -0.1 0.3 -0.5 0.0 -0.2 -0.2 0.0 -0.6 0.2 -0.3 0.4 0.0

- Magnitude of the amplitude is the volume
 - 0 is lowest volume (silence)
 - 1 is maximum volume of sound card
 - Multiply by number 0 to 1 to change global volume

• Sound data is an array of **sample** values

- Magnitude of the amplitude is the volume
 - 0 is lowest volume (silence)
 - 1 is maximum volume of sound card
 - Multiply by number 0 to 1 to change global volume

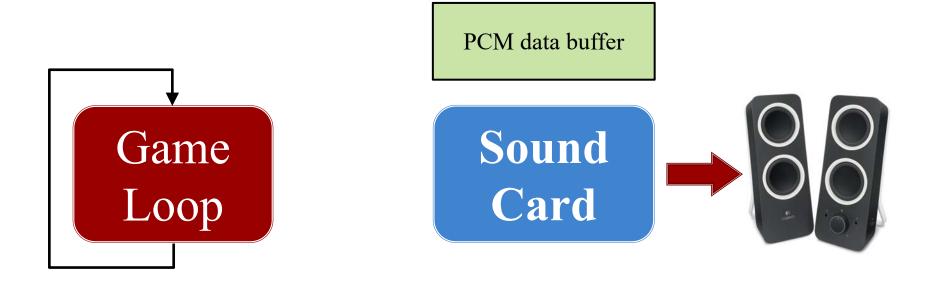

• Samples are organized into (interleaved) channels

- Each channel is essentially a speaker
 - Mono sound has one channel
 - Stereo sound has two channels
 - 7.1 surround sound is *eight* channels
- A **frame** is set of simultaneous samples
 - Each sample is in a separate frame

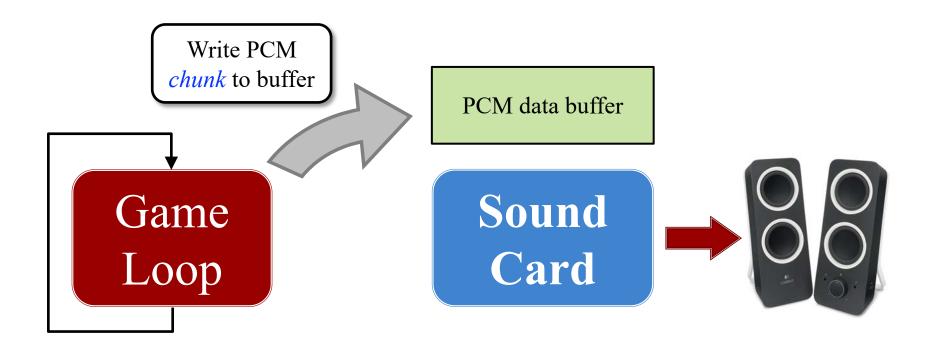

- The sample rate is frames per second 1 second # frames • **Example**: 0.5 seconds of stereo at 44.1 kHZ • 0.5 s * 44100 f/s = 22050 frames
 - 2 samples/frame * 22050 frames = 44100 samples
 - 4 bytes/sample * 44100 samples = 176.4 kBytes
- 1 minute of stereo CD sound is 21 MB!

Playing Sound Directly

Playing Sound Directly

Direct Sound in LibGDX: AudioDevice

/**
 * Writes the array of float PCM samples to the audio device.
 *

* This method blocks until they have been processed. */

void writeSamples(float[] samples, int offset, int numSamples)

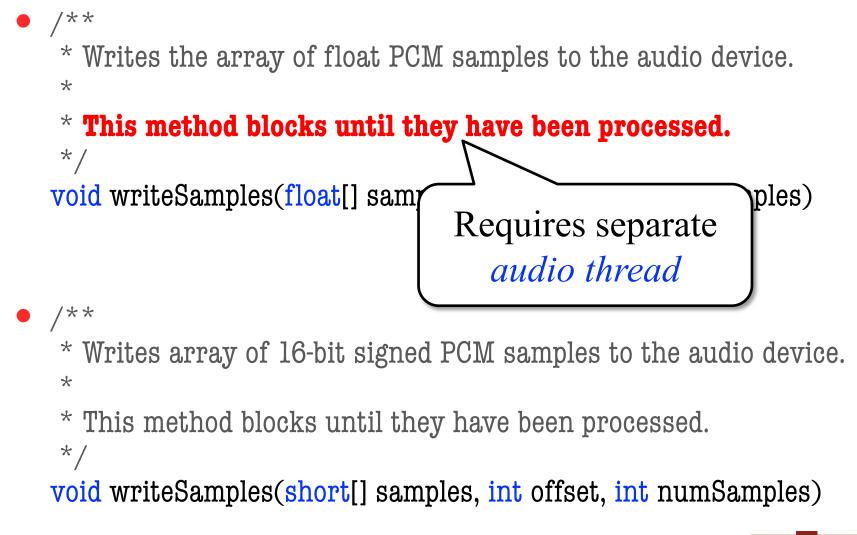

/**
 * Writes array of 16-bit signed PCM samples to the audio device.
 *

* This method blocks until they have been processed.
*/

void writeSamples(short[] samples, int offset, int numSamples)

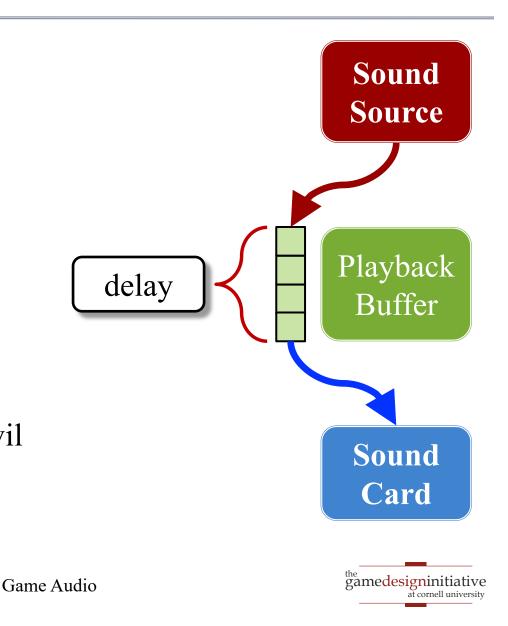

Direct Sound in LibGDX: AudioDevice

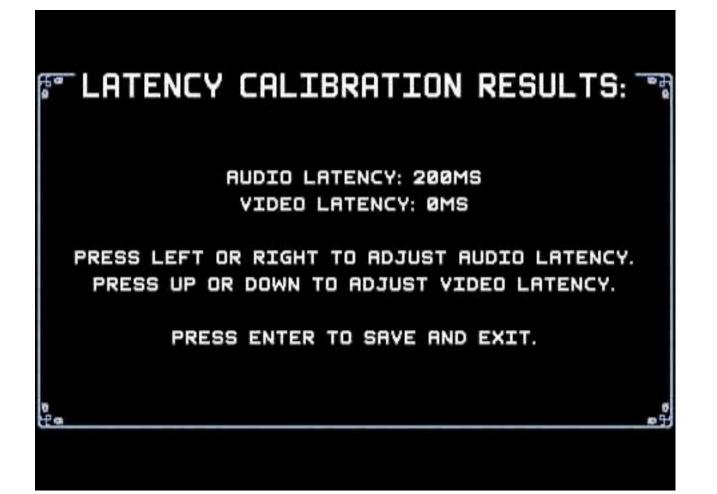

The Latency Problem

- Buffer is really a *queue*
 - Output from queue front
 - Playback writes to end
 - Creates a *playback delay*
- Latency: amount of delay
 - Some latency must exist
 - Okay if latency \leq framerate
 - Android latency is ~90 ms!
- Buffering is a necessary evil
 - Keeps playback smooth
 - Allows real-time *effects*

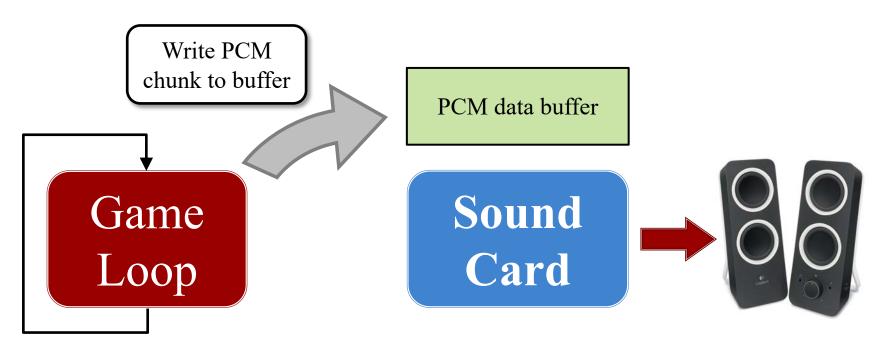

Calibration

Playing Sound Directly

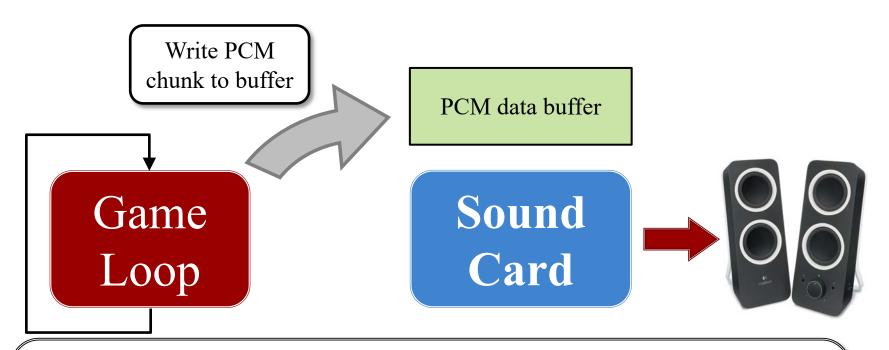

Choice of buffer size is important!

- **Too large**: *long* latency until next sound plays
- **Too small**: buffers swap too fast, causing audible pops

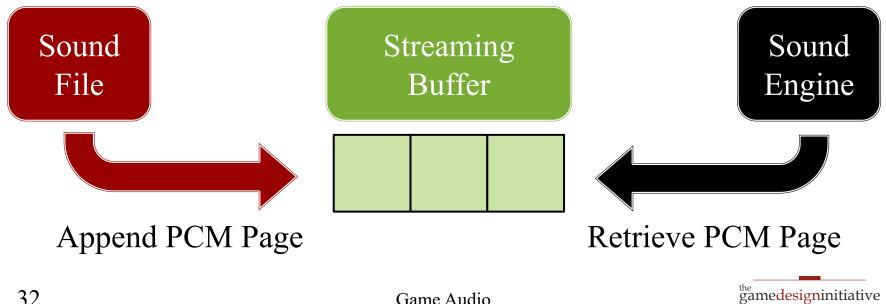

Playing Sound Directly

- Windows: 528 bytes (even if you ask for larger)
- MacOS, iOS: 512-1024 bytes (hardware varies)
- Android: 2048-4096 bytes (hardware varies)

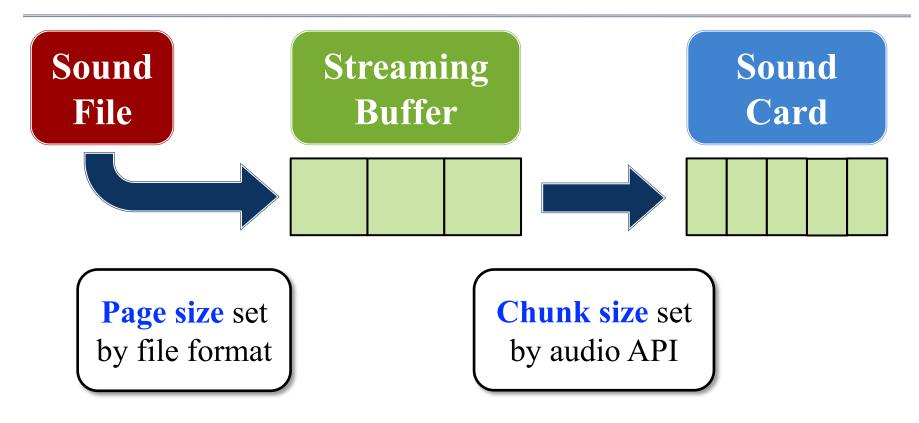

How Streaming Works

- All sound cards **only** play PCM data
 - Other files (MP3 etc.) are decoded into PCM data
 - But the data is *paged-in* like memory in an OS
- Why LibGDX/CUGL can stream WAV files too!

at cornell university

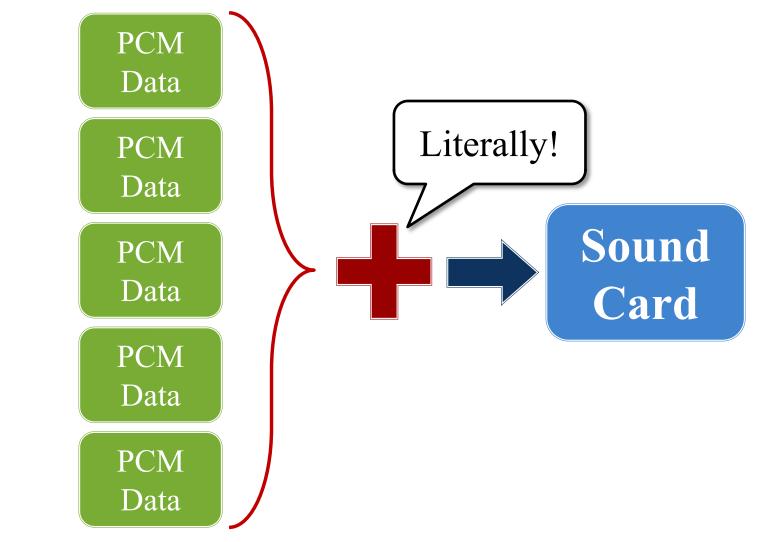

How Streaming Works

- **Sound**: Sound asset that is *preloaded* as full PCM
- **Music**: Sound asset that is *streamed* as PCM pages

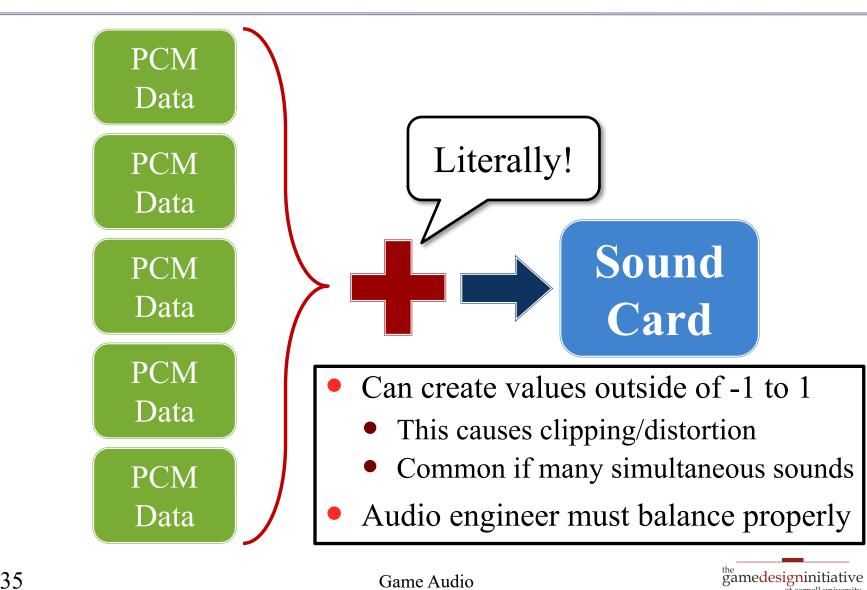

Handling Multiple Sounds

Handling Multiple Sounds

Game Audio

at cornell university

Why is Mixing Hard?

- Playback may include **multiple sounds**
 - Sounds may play simultaneously (offset)
 - Simultaneous sounds may be same asset
 - Asset (source) vs. Instance (playback)
- Playback crosses **frame boundaries**
 - It may span multiple animation frames
 - Need to know when it stops playing
 - May need to stop (or pause) it early

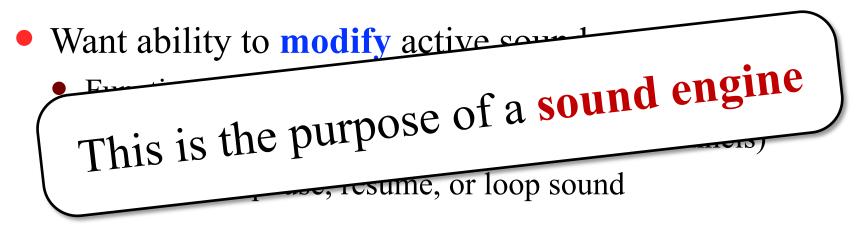

We Want Something Simpler!

- Want ability to **play** and **track** sounds
 - Functions to load sound into card buffer
 - Functions to detect if sound has finished
- Want ability to **modify** active sounds
 - Functions for volume and pitch adjustment
 - Functions for stereo panning (e.g. left/right channels)
 - Functions to pause, resume, or loop sound
- Want ability to **mix** sounds together
 - Functions to add together sound data quickly
 - Background process for dynamic volume adjustment

We Want Something Simpler!

- Want ability to **play** and **track** sounds
 - Functions to load sound into card buffer
 - Functions to detect if sound has finished

- Want ability to **mix** sounds together
 - Functions to add together sound data quickly
 - Background process for dynamic volume adjustment

Cross-Platform Sound Engines

- OpenAL
 - Created in 2000 by Loki Software for Linux
 - Was an attempt to make a sound standard
 - Loki went under; last stable release in 2005
 - Apple supported, but HARD deprecated in iOS 9
- FMOD/WWISE
 - Industry standard for game development
 - Mobile support is possible but not easy
 - Not free; but no cost for low-volume sales

Proprietary Sound Engines

- Apple AVFoundation
 - API to support modern sound processing
 - Mainly designed for music/audio creation apps
 - But very useful for games and playback apps
- OpenSL ES
 - Directed by Khronos Group (OpenGL)
 - Substantially less advanced than other APIs
 - Really only has support in Android space
 - Google deprecated in 2022 (it was **BAD**!)

Proprietary Sound Engines

• Apple AVFoundation

B

- API to support modern sound processing
- Mainly designed for music/audio creation apps
 - And many competing 3rd party solutions
- Directed by Khronos Group (OpenGL)
- Substantially less advanced than other APIs
- Really only has support in Android space
- Google deprecated in 2022 (it was **BAD**!)

What Does LibGDX Use?

- LibGDX support is actually OS specific
 - Recall the core/desktop package distinction
 - Because LibGDX supports mobile and computer
- Different platforms have different backends
 - All desktop platforms are built on **OpenAL**
 - The android backend uses android.media
- Needs an **abstraction** bringing all together
 - This is done with the Audio interface

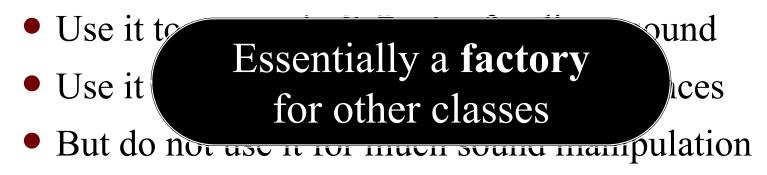

The LibGDX Audio Interface

- LibGDX provides an audio **singleton**
 - One global object referencing audio device
 - Access via GDX.audio (static field of GDX)
 - Same principle as System.out
- Singleton implements the Audio interface
 - Use it to access AudioDevice for direct sound
 - Use it to allocate new Sound, Music instances
 - But do not use it for much sound manipulation

The LibGDX Audio Interface

- LibGDX provides an audio **singleton**
 - One global object referencing audio device
 - Access via GDX.audio (static field of GDX)
 - Same principle as System.out
- Singleton implements the Audio interface

The LibGDX Sound Classes

Sound

• Primary method is play()

- Returns a long integer
- Represents sound *instance*
- loop() is a separate method
- Has no public constructor
 - Use Audio.newSound(f)
 - Audio can cache/preload
- Must dispose when done

• Primary method is play()

Music

- This is a void method
- Only allows **one instance**
- loop is an attribute of music
- Has no public constructor
 - Use Audio.newMusic(f)
 - Audio can cache the file
- Must dispose when done

Playing a Sound

- Playback may include **multiple sounds**
 - Sounds may play simultaneously (offset)
 - Simultaneous sounds may be same asset
 - Asset (source) vs. Instance (playback)
- Playback crosses **frame boundaries**
 - It may span multiple animation frames
 - Need to know when it stops playing
 - May need to stop (or pause) it early

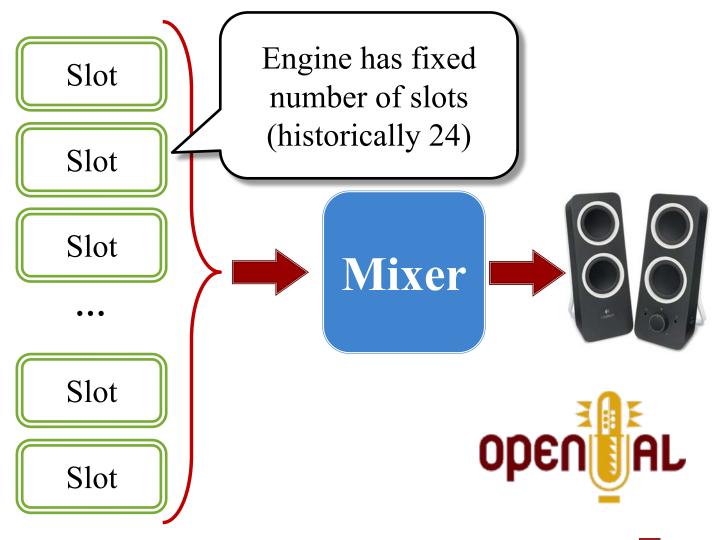

Playing a Sound

- Playback may include **multiple sounds**
 - Sounds may play simultaneously (offset)
 - Simultaneous sounds may be same asset

Requires an understanding of OpenAL

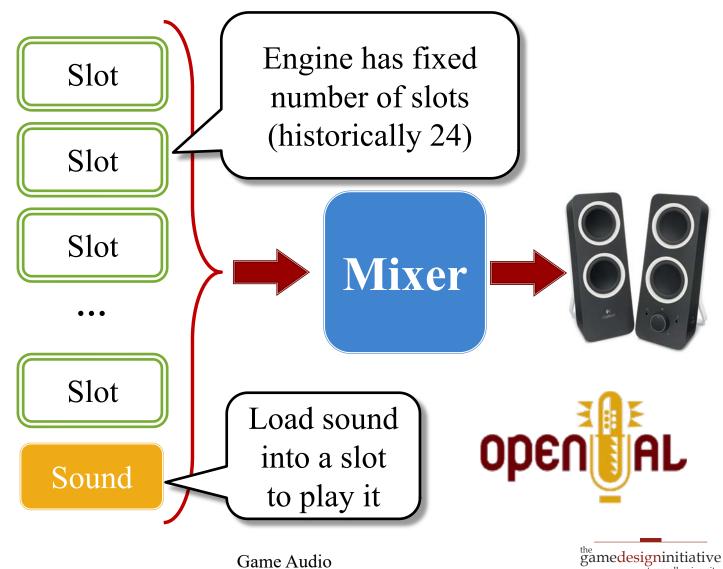

- It may span multiple animation frames
- Need to know when it stops playing
- May need to stop (or pause) it early

Classic Model: Playback Slots

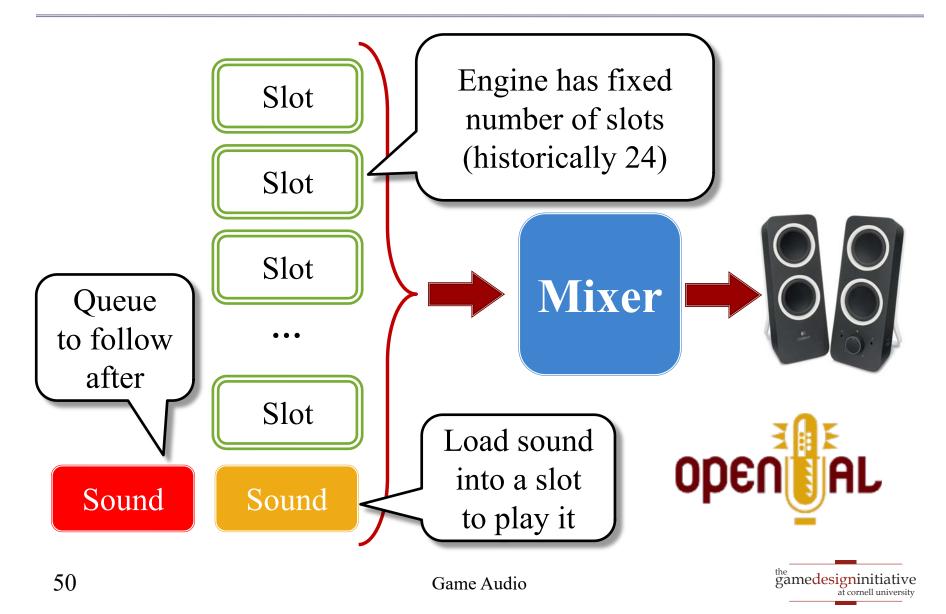

Classic Model: Playback Slots

at cornell university

Game Audio

Classic Model: Playback Slots

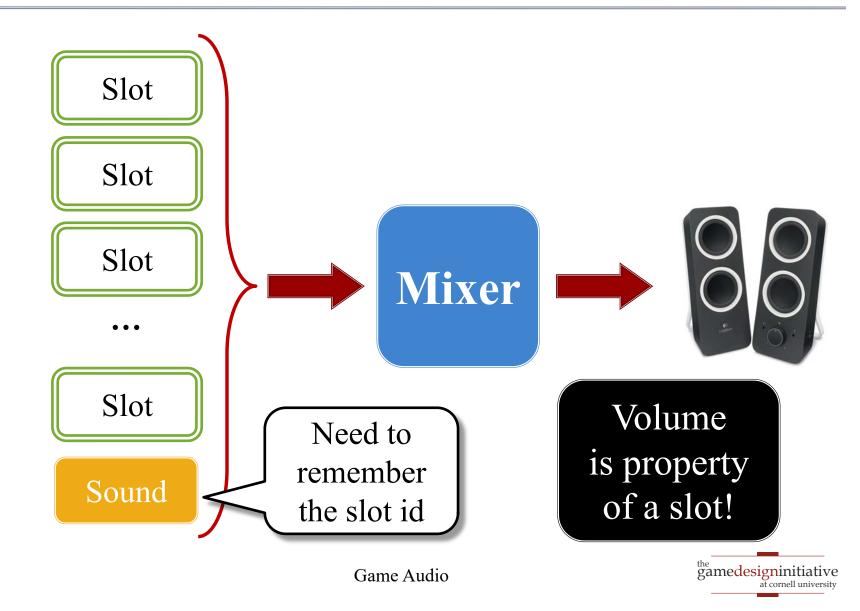

Playing a Sound with Slots

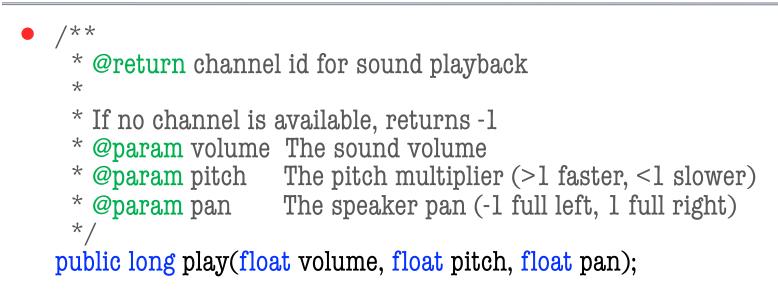

- **Request** a playback slot for your asset
 - If none is available, sound fails to play
 - Otherwise, it gives you an id for the slot
- Load asset into the slot (but might stream)
- Play the playback slot
 - Playing is a property of the slot, not asset
 - Playback slot has other properties, like volume
- **Release** the slot when the sound is done
 - This is usually done automatically

Application Design

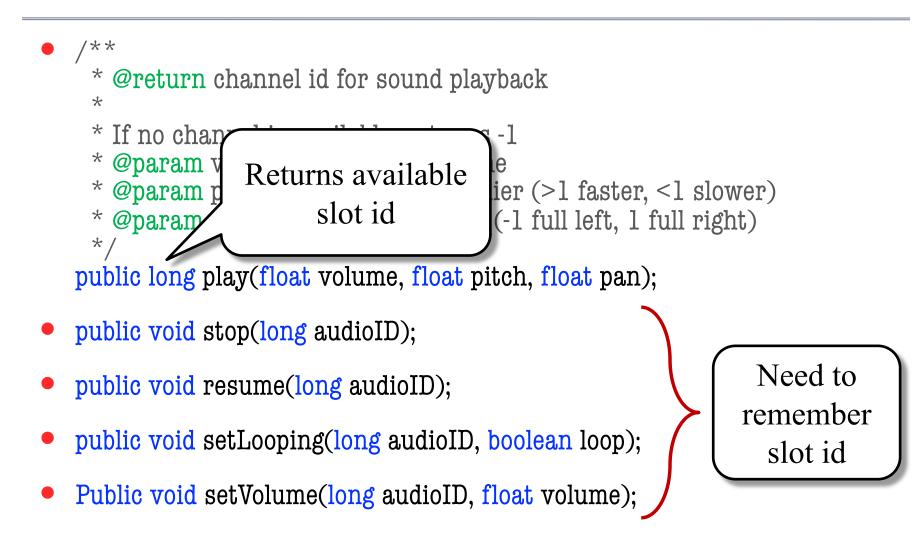

The Sound API

- public void stop(long audioID);
- public void resume(long audioID);
- public void setLooping(long audioID, boolean loop);
- Public void setVolume(long audioID, float volume);

The Sound API

Why This is Undesirable

- Tightly couples architecture to sound engine
 - All controllers need to know this channel id
 - Playback must communicate the id to all controllers
- Instances usually have a *semantic meaning*
 - **Example**: Torpedo #3, Ship/crate collision
 - Meaning is independent of the channel assigned
 - Would prefer to represent them by this meaning
- **Solution**: Refer to instances by *keys*

Idea: SoundManager Class

- A SoundManager is essentially a hashmap
 - Map strings (keys) to integers (slot ids)
 - Only stores a key when instance is playing
- This class needs to be a **singleton**
 - So we can access this anywhere at all time
 - **Demo:** See the class provided with this lecture
- To work, the map must be **up-to-date** at all times
 - We use this controller to play the sounds
 - And it must be notified when a sound is done

Stopping Sounds

- Would like to know when a sound is finished
 - To free up the slot (if not automatic)
 - To stop any associated animation
 - To start a follow-up sound
- Two main approaches
 - **Polling**: Call an isPlaying() method
 - **Callback**: Pass a function when play
- Default LibGDX cannot do *either* of these

Stopping Sounds

- Would like to know when a sound is finished
 - To free up the slot (if not automatic)
 - To stop any associated animation
 - To start a follow-up sound
- Two main approaches
 - **Polling**: Call an isPlaying() method
 - Callback: Pass a function when play
- Default LibGDX cannot do *either* of these

Cannot do in

android.media

Solution: AudioEngine

- You are all making **desktop games**
 - This means you are always using OpenAL
 - Just need a way to expose OpenAL features
 - This is the purpose of GDIAC audio backend
- Basic interface is AudioEngine
 - Upcast GDX.audio to this interface
 - Now have access to SoundEffect, MusicQueue
 - These classes give extra features you need
- Note: AssetDirectory handles this automatically

The GDIAC Sound Classes

SoundEffect

- Works just like Sound
 - Primary method is play()
 - Returns a long integer
- But has playback control
 - Can poll if still playing
 - Can add listener to monitor
- Exposes OpenAL features
 - Elapsed playback time
 - Panning between speakers
 - Sound pitch control

MusicQueue

- Works just like Music
 - Primary method is play()
 - This is a void method
- But has a playback queue
 - Can add **AudioSource** to it
 - Provides gapless playback
- Methods manage the queue
 - Add or remove music
 - Swap out music at position
 - Skip over current music

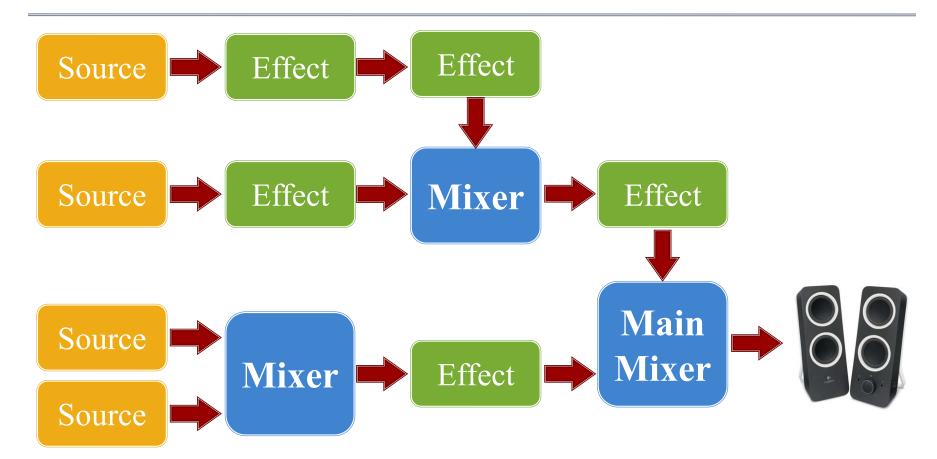

Problem with the Slots Model

- All controls are embedded in the slot
 - **Example**: Volume, looping, play position
 - Restricted to a *predetermined* set of controls
- Modern games want *custom sound-processing*
 - User defined sound filters (low pass, reverb)
 - Advanced equalizer support
 - Support for surround and 3D sound
 - Procedural sound generation

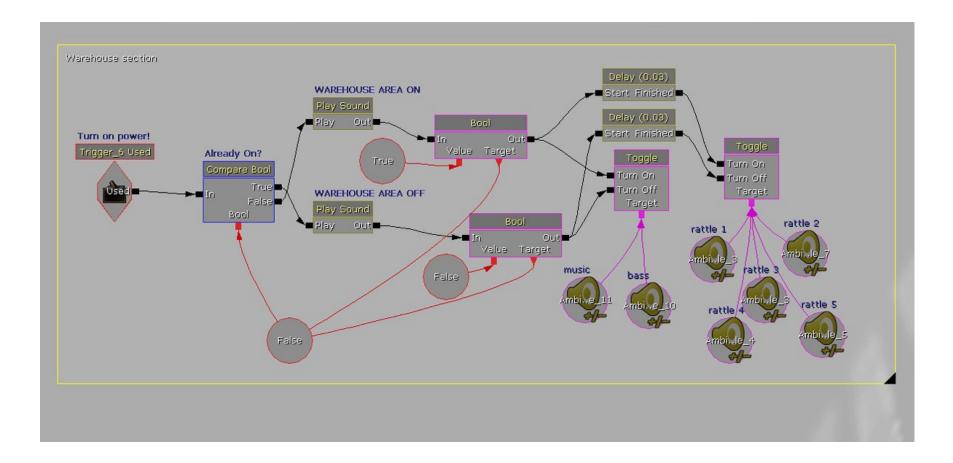

DSP Processing: The Mixer DAG

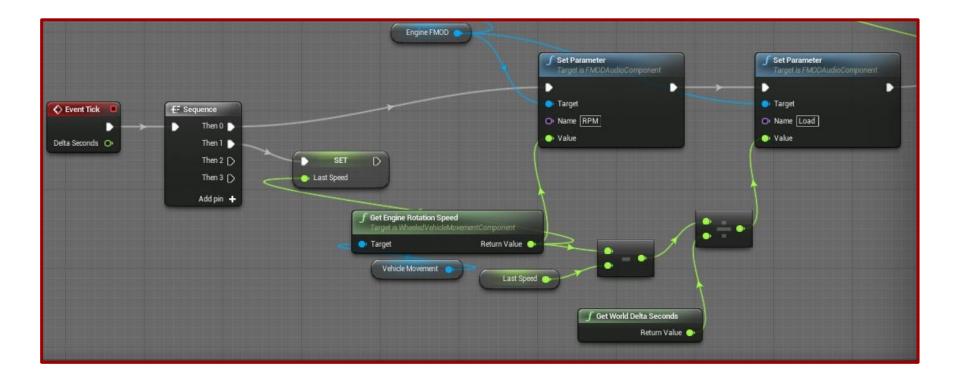

Example: UDK Kismet

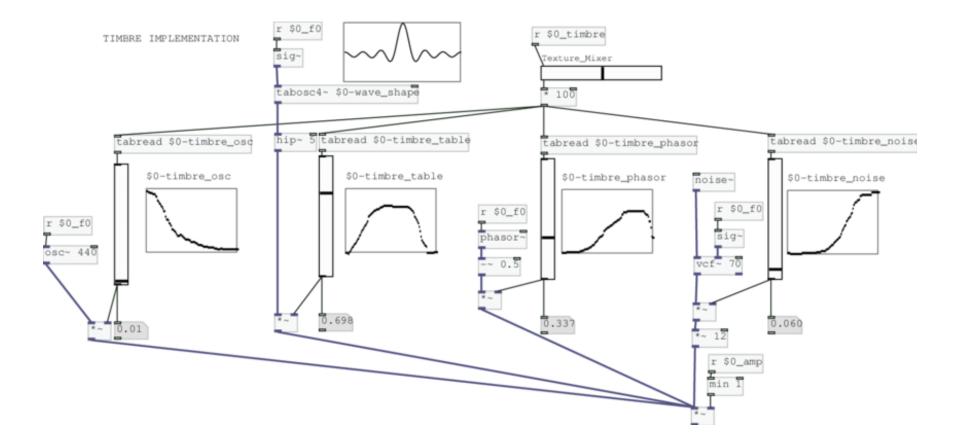

Example: FMOD

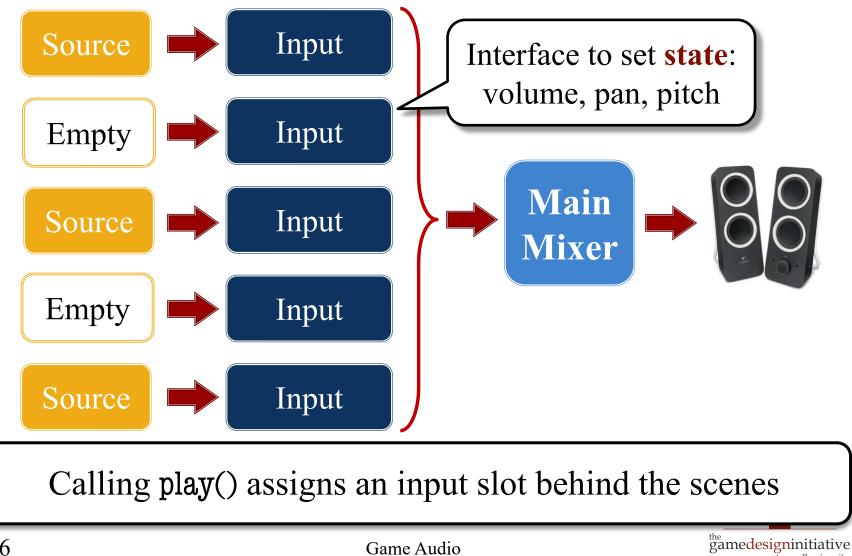

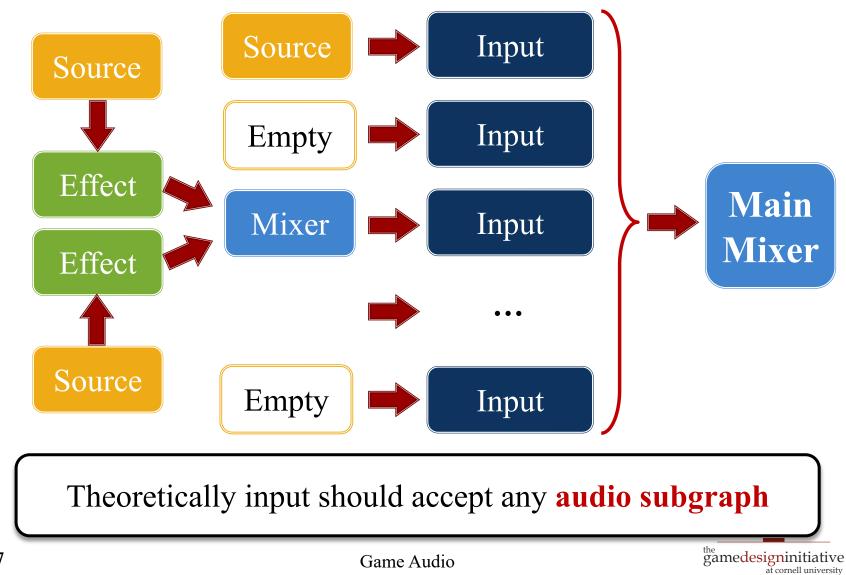

Example: Pure Data

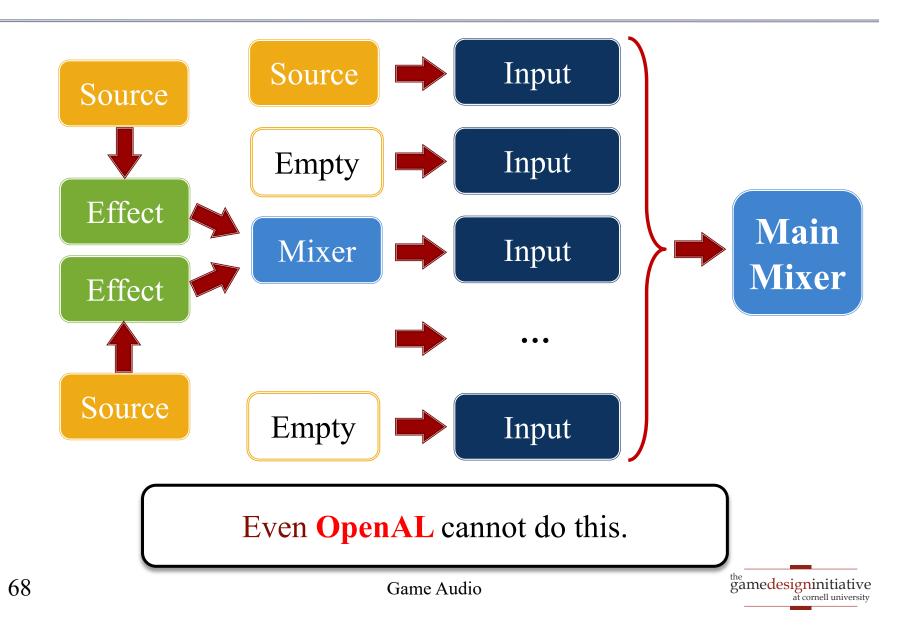

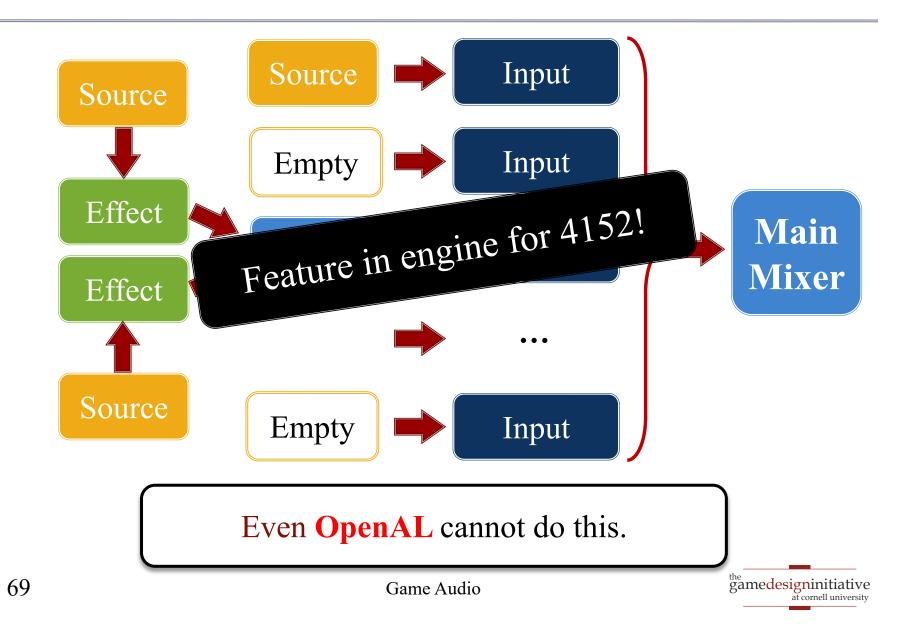

at cornell university

Summary

- Audio design is about creating soundscapes
 - Music, sound effects, and dialogue
 - Combining sounds requires a sound engine
- Cross-platform support is a problem
 - Licensing issues prevent a cross-platform format
 - Very little standardization in sound APIs
- Best engines use digital signal processing (DSP)
 - Mixer graph is a DAG supporting sound effects
 - Unfortunately, we cannot do this in LibGDX
