

CS 316

Intro to Computer System Organization and Programming

Kavita Bala
Fall 2007
Computer Science
Cornell University

Information

- Instructor: Kavita Bala (kb@cs.cornell.edu)
- Tu/Th 1:25-2:40 Hollister B14

Course Objective

- Bridge the gap between hardware and software
 - How a processor works
 - How a computer is organized
- Establish a foundation for building higher-level applications
 - How to understand program performance
 - How to understand where the world is going

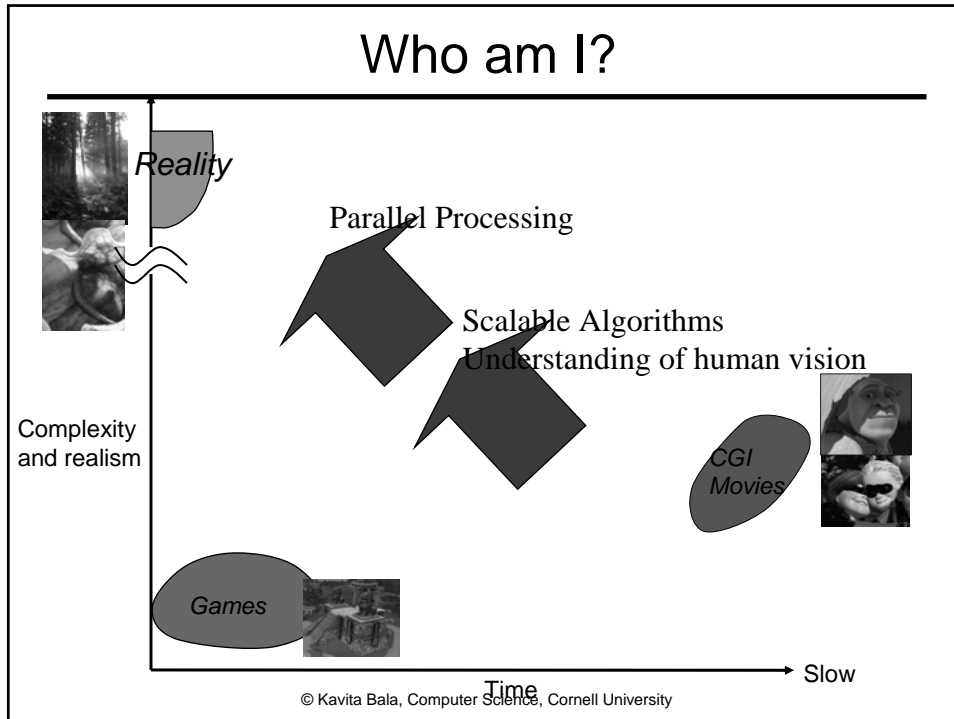

© Kavita Bala, Computer Science, Cornell University

Who am I?

- Current life
 - Graphics
 - Parallel processing in graphics
- Previous life
 - Compilers
 - Operating Systems
 - Networks

© Kavita Bala, Computer Science, Cornell University

- ## Course Staff
- TAs
 - Adam Arbree (arbree@cs.cornell.edu)
 - Jed Liu (liujed@cs.cornell.edu)
 - Robert Burgess (burgess@cs.cornell.edu)
 - Undergraduate consultants:
 - Daniel Margo, Matt Oliveri, Ben Pu
 - AA: Amy Fish (amyfish@cs.cornell.edu)
 - Sections:
 - Tu/Th/Fr 2:55-4:10
 - Wednesday section cancelled
- © Kavita Bala, Computer Science, Cornell University

Book

- Computer Organization and Design
 - The Hardware/Software Interface
- David Patterson, John Hennessy
 - Get revised printing from summer

© Kavita Bala, Computer Science, Cornell University

Course

- Programming Assignments: 6-8
 - Work in groups of 2
- Homeworks: 4-5
 - Work alone
- 2 prelims, 1 final project

© Kavita Bala, Computer Science, Cornell University

Grading

- Breakdown
 - 35-50% Projects (approx. 8 assignments)
 - 30-40% Prelims (2)
 - 15-20% Homeworks (approx. 4-5)
 - 5% Flexgrade (participation, attitude, improvement and effort)

© Kavita Bala, Computer Science, Cornell University

Administrivia

- <http://www.cs.cornell.edu/courses/cs316/2007fa>
 - Updates
 - Schedule
 - Lecture notes
 - Office hours
 - Homeworks, etc.

© Kavita Bala, Computer Science, Cornell University

Communication

- Email
 - cs316-l@cs.cornell.edu
 - The email alias goes to me and the TAs, not to whole class
- Mailing list for students
 - Sign up sheet

© Kavita Bala, Computer Science, Cornell University

Sections & Projects

- Sections start next week
- Projects will be done in two-person teams
 - We will pair you up if you don't have a preferred partner
 - Start early, time management is key
 - Manage the team effort

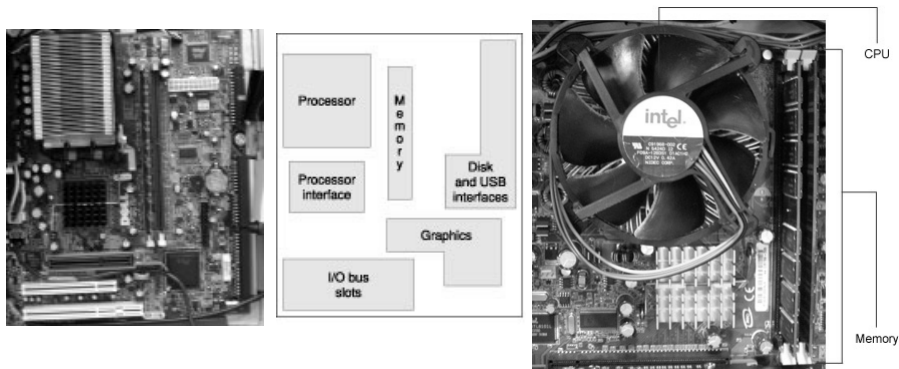

© Kavita Bala, Computer Science, Cornell University

Academic Integrity

- All submitted work must be your own
 - OK to study together
 - Cannot share solutions however
- Project groups submit joint work
 - Same restrictions apply to projects at the group level
 - Cannot be in possession of someone else's solution
- Closed-book exams, no calculators

© Kavita Bala, Computer Science, Cornell University

Computer System Organization

© Kavita Bala, Computer Science, Cornell University

Transistors and Gates

| In | Out |
|----|-----|
| 0 | 1 |
| 1 | 0 |

Truth table

Logic and State

© Kavita Bala, Computer Science, Cornell University

A Calculator

© Kavita Bala, Computer Science, Cornell University

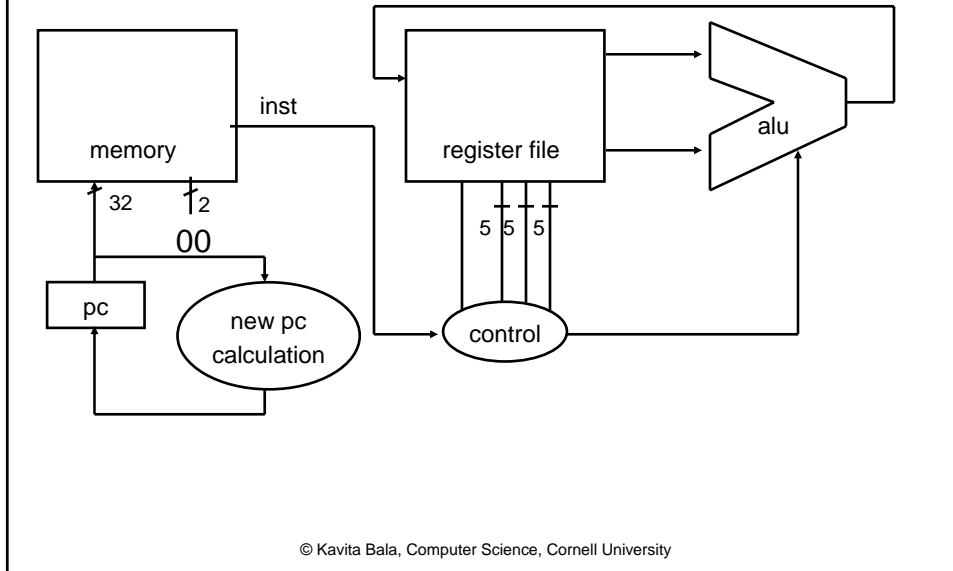

Basic Computer System

- A processor executes instructions
 - Processor has some internal state in storage elements (registers)
- A memory holds instructions and data
 - von Neumann architecture: combined inst and data
- A bus connects the two

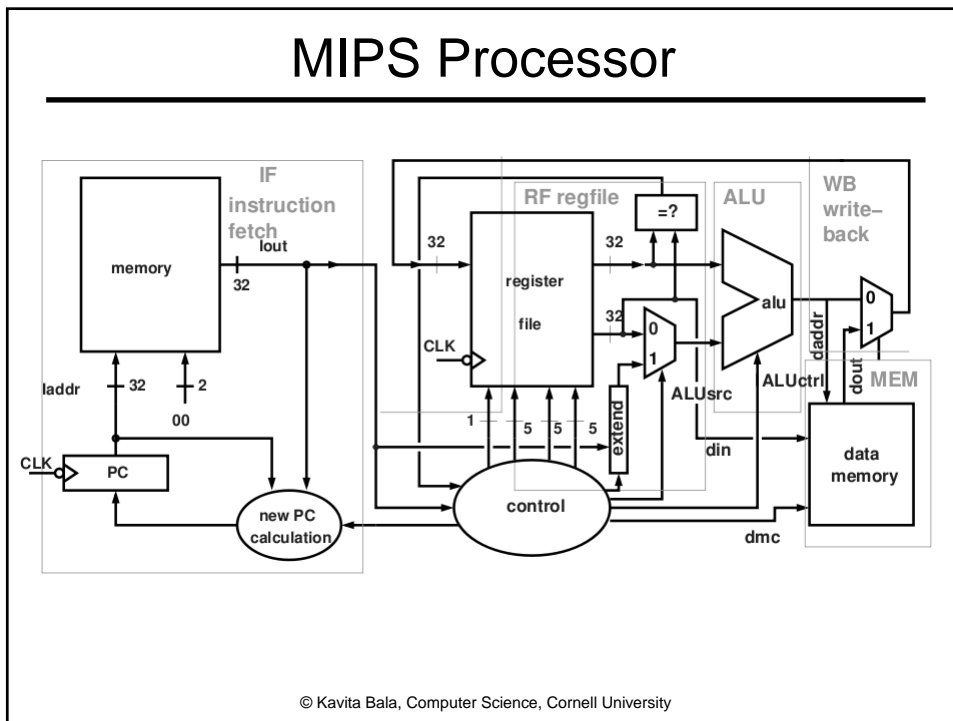

© Kavita Bala, Computer Science, Cornell University

Simple Processor

MIPS Processor

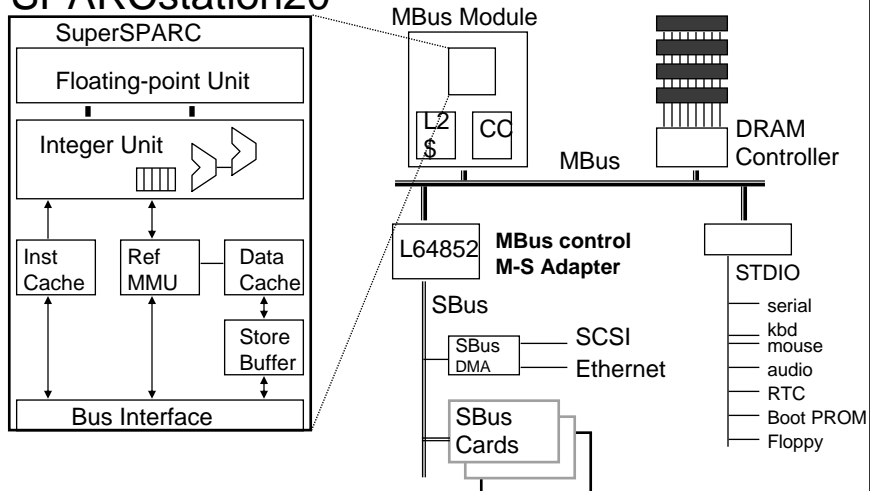

Computer System Organization

© Kavita Bala, Computer Science, Cornell University

Example Machine Organization

- TI SuperSPARC™ TMS390Z50 in Sun SPARCstation20

© Kavita Bala, Computer Science, Cornell University

Why should you care?

- Bridge the gap between hardware and software
 - How a processor works
 - How a computer is organized
- Establish a foundation for building higher-level applications
 - How to understand program performance
 - How to understand where the world is going

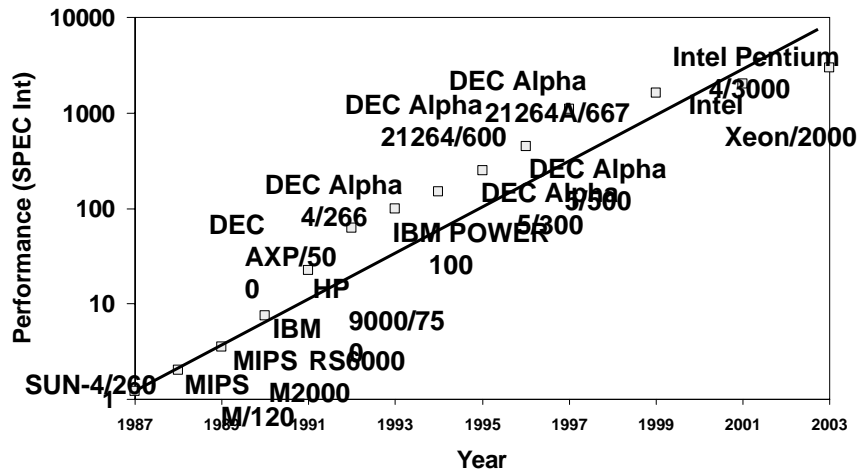

© Kavita Bala, Computer Science, Cornell University

Moore's Law

- 1965
 - number of transistors that can be integrated on a die would double every 18 to 24 months (i.e., grow exponentially with time).
- Amazingly visionary
 - 2300 transistors, 1 MHz clock (Intel 4004) - 1971
 - 16 Million transistors (Ultra Sparc III)
 - 42 Million transistors, 2 GHz clock (Intel Xeon) – 2001
 - 55 Million transistors, 3 GHz, 130nm technology, 250mm² die (Intel Pentium 4) – 2004
 - 290+ Million transistors, 3 GHz (Intel Core 2 Duo) – 2007

© Kavita Bala, Computer Science, Cornell University

Computer System Programming

© Kavita Bala, Computer Science, Cornell University

Instruction Set Architecture (ISA)

- ISA
 - abstract interface between hardware and the lowest level software

 - user portion of the instruction set plus the operating system interfaces used by application programmers

© Kavita Bala, Computer Science, Cornell University

Overview

© Kavita Bala, Computer Science, Cornell University

MIPS R3000 ISA

- Instruction Categories

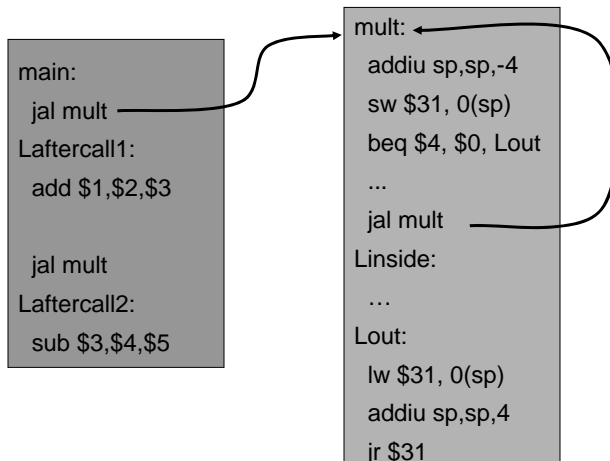

- Load/Store
- Computational
- Jump and Branch
- Floating Point
 - coprocessor
- Memory Management

Registers

© Kavita Bala, Computer Science, Cornell University

Calling Conventions

© Kavita Bala, Computer Science, Cornell University

Data Layout

```
blue() {  
    pink(0,1,2,3,4,5);  
}  
pink() {  
    orange(10,11,12,13,14);  
}
```

© Kavita Bala, Computer Science, Cornell University

Buffer Overflows

```
blue() {  
    pink(0,1,2,3,4,5);  
}  
pink() {  
    orange(10,11,12,13,14);  
}  
orange() {  
    char buf[100];  
    gets(buf); // read string, no check  
}
```

© Kavita Bala, Computer Science, Cornell University

Parallel Processing

- Spin Locks
- Shared memory, multiple cores
- Etc.

© Kavita Bala, Computer Science, Cornell University

Can answer the question.....

- A: for $i = 0$ to 99
 - for $j = 0$ to 999
 - $A[i][j] = \text{Computation} ()$
- B: for $j = 0$ to 999
 - for $i = 0$ to 99
 - $A[i][j] = \text{complexComputation} ()$
- Why is B 15 times slower than A?

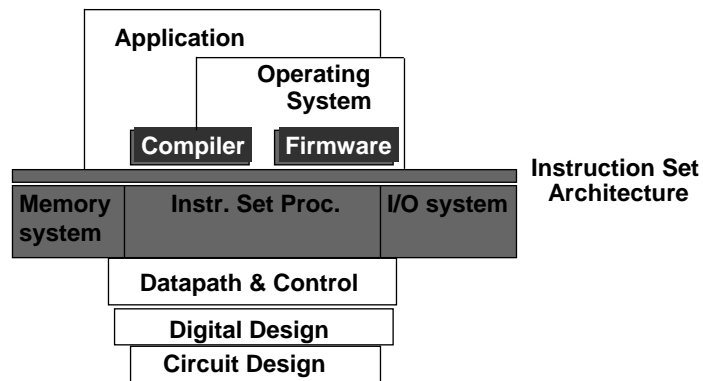

© Kavita Bala, Computer Science, Cornell University

Applications

- Distributed ray tracer
 - Multiple cores running highly parallel application
 - Great images!
- Core war
 - Corrupt your neighbors context!

© Kavita Bala, Computer Science, Cornell University

Covered in this course

© Kavita Bala, Computer Science, Cornell University

Nuts and Bolts: Switches, Transistors, Gates

A switch

- A switch is a simple device that can act as a conductor or isolator
- Can be used for amazing things...

© Kavita Bala, Computer Science, Cornell University

Switches

- Either (OR)

- Both (AND)

- But requires mechanical force

© Kavita Bala, Computer Science, Cornell University

Transistors

- Solid-state switch
 - The most amazing invention of the 1900s

- PNP and NPN

© Kavita Bala, Computer Science, Cornell University

Transistors

- Semi-conductor

© Kavita Bala, Computer Science, Cornell University

P and N Transistors

- PNP Transistor

- Connect E to C when base = 0

- NPN Transistor

- Connect E to C when base = 1

© Kavita Bala, Computer Science, Cornell University

Then and Now

- The first transistor
 - on a workbench at AT&T Bell Labs in 1947

- An Intel Pentium
 - 125 million transistors

© Kavita Bala, Computer Science, Cornell University

Inverter

| In | Out |
|----|-----|
| 0 | 1 |
| 1 | 0 |

Truth table

- Function: NOT
- Called an inverter
- Symbol:

- Useful for taking the inverse of an input

- CMOS: complementary-symmetry metal-oxide-semiconductor

© Kavita Bala, Computer Science, Cornell University

NAND Gate

| A | B | out |
|---|---|-----|
| 0 | 0 | 1 |
| 1 | 0 | 1 |
| 0 | 1 | 1 |
| 1 | 1 | 0 |

- Function: NAND
- Symbol:
