4. 

i) Find a context-free grammar such that $L(G)=\left\{w \in\{0,1\}^{*} \mid \#_{0}(w)=\#_{1}(w)\right\}$.

## Solution:

S $\rightarrow$ OS1 \| 1 SO ISS I $\varepsilon$

In order to prove this claim, need to show:
a) $\forall \alpha \in(N \cup \Sigma)^{\star}$, if $S \rightarrow{ }_{G}{ }^{*} \alpha$ then $\alpha$ satisfies i) $\#_{0}(\alpha)=\#_{1}(\alpha)$
b) $\forall \chi$ s.t. $\mid \#_{0}(\chi)=\#_{1}(\chi)$ then $S \rightarrow_{G}{ }^{*} \chi$
a) Induction on the length of the derivation $S \rightarrow{ }_{G}{ }^{*} \alpha$

## Basis

If $\mathrm{S} \rightarrow{ }_{G}{ }^{0} \alpha$, then $\alpha=\mathrm{S}$. The sentential form trivially satisfies condition i )
Induction Hypothesis
Let $\mathrm{S} \rightarrow{ }_{G}{ }^{\mathrm{n}} \beta$ satisfy condition i)
Induction Step
Suppose $S \rightarrow{ }_{G}{ }^{n+1} \alpha$. Let $\beta$ be the sentential form immediately preceding $\alpha$ such that $S \rightarrow_{G}{ }^{n} \beta S \rightarrow_{G}{ }^{1} \alpha$. By I.H. $\beta$ satisfies i).

Consider four cases corresponding to 4 possible productions of grammar to derive $\alpha$ from $\beta$ :

- $S \rightarrow$ SS I $\varepsilon$ cases trivial, neither changes number of 1 's and 0 's $\therefore$ condition i) would still hold for $\alpha$
- $\mathrm{S} \rightarrow$ OS1

$$
\begin{aligned}
& \exists \beta_{1}, \beta_{2}, \beta_{1}, \beta_{2} \in(\mathrm{~N} \cup \Sigma)^{\star} \text { s.t. } \beta=\beta_{1} \mathrm{~S} \beta_{2} \text { and } \alpha=\beta_{1} 0 \mathrm{~S} 1 \beta_{2} \\
& \#_{0}(\alpha)=\#_{0}(\beta)+1 \\
& =\#_{1}(\beta)+1 \text { (since } \beta \text { satisfies i) } \\
& =\#_{1}(\alpha)
\end{aligned}
$$

so i) holds for $\alpha$

- $S \rightarrow 1$ S0, same as above

Thus, in all cases $\alpha$ meets condition i). This concludes the proof that if $S \rightarrow{ }_{G}{ }^{*} \alpha$ then $\#_{0}(\alpha)=\#_{1}(\alpha)$. $S \rightarrow 0$ S1 | 1SO ISS I $\varepsilon$
b) Induction on the length of $|\chi|$

## Basis

If $|\chi|=0$, we have $\chi=\varepsilon$, and $S \rightarrow{ }_{G}^{*} \chi$ using $S \rightarrow \varepsilon$
Induction Hypothesis
$\forall|\chi| \leq n-1$ s.t. $\#_{0}(\chi)=\#_{1}(\chi)$, let $S \rightarrow_{G}{ }^{*} \chi$

## Induction Step

Let $|\chi|=n$ then consider two cases:

1. there exists a proper prefix $y$ of $\chi$ (one such that $0<|y|<|\chi|$ ) satisfying i)
2. no such prefix exists
1) $\chi=y z$ for some $z, 0<|z|<|\chi|$, and $z$ also satisfies $i)$ :

$$
\#_{0}(z)=\#_{0}(x)-\#_{0}(y)=\#_{1}(x)-\#_{1}(y)=\#_{1}(z)
$$

By I.H. $S \rightarrow_{G}{ }^{*} y$ and $S \rightarrow{ }_{G}{ }^{*} z$. We can then derive $\chi$ by:

$$
\mathrm{S} \rightarrow{ }_{\mathrm{G}}{ }^{1} \mathrm{SS} \rightarrow_{\mathrm{G}}{ }^{*} \mathrm{yS} \rightarrow_{\mathrm{G}}{ }^{*} \mathrm{yz}=\chi
$$

2) no such y exists :

- $\chi=1 \mathrm{z} 0$ for some $z$, and $z$ satisfies i) since:

$$
\#_{0}(z)=\#_{0}(\chi)-1=\#_{1}(\chi)-1=\#_{1}(z)
$$

by $\mathrm{HHS} \rightarrow{ }_{G}{ }^{*} \mathrm{z}$. We can then derive $\chi$ by:

$$
\mathrm{S} \rightarrow \rightarrow_{G}{ }^{1} 1 \mathrm{SO} \rightarrow_{G}{ }^{*} 1 \mathrm{zO}=\chi
$$

- OR $\chi=0 \mathrm{z} 1$ for some $z .$. (repeat above)

Thus, every string satisfying i) can be derived. This concludes the proof that if $\mid \#_{0}(\chi)=\#_{1}(\chi)$ then $S \rightarrow_{G}{ }^{*} \chi$.

Comment: 2 inductions in one problem... what could be more fun? For those of you that used complicated grammars with more productions, keep in mind fewer productions is easier come time for you to prove your claim. For those of you who gave incorrect grammars and then "proved" both directions... obviously your proof cannot be correct.
