

## Improving performance

Matlab's a pig

---

---

---

---

---

---

---

---

## Outline

- Announcements:
  - Homework I: Solutions on web
  - Homework II: on web--due Wed.
- Homework I
- Performance Issues

---

---

---

---

---

---

---

---

## Homework I

- Grades & comments are waiting in your mailboxes
  - PASS--you passed!
    - try to learn from your mistakes
  - PROVISIONAL--you passed, but I'm watching
    - 2 or more provisional passes will make it difficult for me to let you pass
  - FAIL--you're failing and need to see me ASAP
    - No one yet!

---

---

---

---

---

---

---

---

## Homework I

- Most everyone did well on 1-4
  - check the comments I sent
- 5 and 6 gave people fits
  - Need to understand the solutions in order to solve next assignment.

---

---

---

---

---

---

---

---

## Homework

- "Essential knowledge" questions should be fairly easy
  - just the basics covered in lecture
- "Programming" questions will be harder
  - apply what we've talked about to a real problem
- The goal of the problem sets is to build your skill and confidence
  - I don't intend for this to be painful
  - If you find that you're spending several hours on a problem, please see me.

---

---

---

---

---

---

---

---

## Fourier Series--Problems 5-6

- We can represent a function  $x(t)$  by sines & cosines
- Define a vector of times  $t$  for which we want to know the value of  $x$ .
  - $t$  and  $x$  are vectors of the same size.
- The  $j$ th entry in  $x$  will be its value at time  $t(j)$  is given by:

$$x(j) = \sum_{k=1}^{N/2+1} a_k \cos\left(\frac{2\pi(k-1)t(j)}{Ndt}\right) + b_k \sin\left(\frac{2\pi(k-1)t(j)}{Ndt}\right)$$

---

---

---

---

---

---

---

---

## Fourier Series--Problems 5-6

- To keep things simple, let's ignore sine terms and pretend the cosines don't exist:

$$x(j) = \sum_{k=1}^{N/2+1} a_k \frac{2\pi(k-1)t(j)}{Ndt}$$

- Can implement this as a double loop:

```
n=length(a); N=2*n-2; p=length(t);
x=zeros(p,1); f=2*pi/(N*dt);
for j=1:p
    for k=1:n
        x(j)=x(j) + a(k)*f*(k-1)*t(j);
    end
end
```

---

---

---

---

---

---

---

---

## Fourier Series--Problems 5-6

- Inner loop looks a lot like a vector product  $c=a*b$ :

```
c=0;
for k=1:n
    c=c + a(k)*b(k);
end
```

- Can eliminate inner loop:

```
n=length(a); N=2*n-2; p=length(t);
x=zeros(p,1); f=2*pi/(N*dt);
K=[1:n]-1;
for j=1:p
    x(j)=f*t(j)*K*a(:);
end
```

---

---

---

---

---

---

---

---

## Fourier Series--Problems 5-6

- If we can use vector \* to eliminate one loop, why not the other?

- Multiplying t & K gives a p-by-n matrix in which each row is K scaled by an element of t:

```
t(:)*K = [t(1)*K;
          t(2)*K;
          :
          t(p)*K]
```

- If we multiply this matrix by a, we get the desired form for x

```
t(k)*K*a(:) = [t(1)*K*a;
               t(2)*K*a;
               :
               t(p)*K*a]
```

---

---

---

---

---

---

---

---

## Problem Set II

- You must implement the scheme we developed as a function
  - Inputs: a, b, t
  - Outputs: x
- You will create another function that will solve for a and b
  - Inputs: x, t
  - Outputs: a, b, f

---

---

---

---

---

---

---

---

## So what's the point?

- Matrix operators in Matlab are much faster than loops
- Example developed above:
  - TwoLoop.m
  - OneLoop.m
  - NoLoop.m
- Fast Matlab code uses \* and avoids loops

---

---

---

---

---

---

---

---

## Some Performance Tips

- Use built-in functions as they are often heavily optimized
  - vectorization is the epitome of this
- Minimize division
  - $x/2$  takes longer than  $0.5*x$
- Do computations outside loop
  - f and K in TwoLoop.m
- Pre-allocate arrays
  - for j=1:n;a(j)=<something>;end
  - Setting `a=zeros(1,n)` before the loop speeds things up

---

---

---

---

---

---

---

---

## Other Options

- subfunctions

```
file fname.m:  
function O=fname(1)  
:  
function O2=fname2(12)  
:
```

- Implement in a compiled language
  - mapping to C and Fortran is straightforward
- Look into Matlab compiler
- Stop being so impatient

---

---

---

---

---

---

---

---

## Some comments on performance

- The Three "E's"
  - Effective
  - Efficient
  - Elegant
- Efficiency (speed) is only one goal.
- Time spent tuning code should be factored into performance
  - Spending 2 hours improving runtime from 10 min to 5 min only makes sense if you will use the code a lot or on much larger problems
