Propositions as Types

Logics = Type Systems

## Inference Rules for Logic

We have used inference rules to build up inductively defined sets of PL concepts: operational steps, valid Hoare triples, associations between terms and types, etc.

Logicians use the same kind of notation to build up the set of true logical formulas.

## Inference Rules for Logic

We have used inference rules to build up inductively defined sets of PL concepts: operational steps, valid Hoare triples, associations between terms and types, etc.

Logicians use the same kind of notation to build up the set of true logical formulas.

Here's a rule from natural deduction, a *constructive* logic invented by logician Gerhard Gentzen in 1935:

$$\frac{\phi \qquad \psi}{\phi \wedge \psi} \wedge \text{-INTRO}$$

Given a proof of  $\phi$  and a proof of  $\psi$ , the rule lets you *construct* a proof of  $\phi \wedge \psi$ .

Let's use our usual 4110 tools to define the set of true formulas ("theorems").

Let's use our usual 4110 tools to define the set of true formulas ("theorems").

We'll start with a grammar for formulas:

$$\begin{array}{cccc} \phi & ::= & \top \\ & | & \bot \\ & | & X \\ & | & \phi \land \psi \\ & | & \phi \lor \psi \\ & | & \phi \to \psi \\ & | & \neg \phi \\ & | & \forall X. \ \phi \end{array}$$

where X ranges over Boolean variables and  $\neg \phi$  is an abbreviation for  $\phi \rightarrow \bot$ .

Let's define a judgment that that a formula is true given a set of assumptions  $\Gamma$ :

$$\Gamma \vdash \phi$$

where  $\boldsymbol{\Gamma}$  is just a list of formulas.

Let's define a judgment that that a formula is true given a set of assumptions  $\Gamma$ :

$$\Gamma \vdash \phi$$

where  $\Gamma$  is just a list of formulas.

If  $\vdash \phi$  (with no assumptions), we say  $\phi$  is a *theorem*.

#### **Examples:**

•  $\vdash A \land B \rightarrow A$ 

Let's define a judgment that that a formula is true given a set of assumptions  $\Gamma$ :

$$\Gamma \vdash \phi$$

where  $\Gamma$  is just a list of formulas.

If  $\vdash \phi$  (with no assumptions), we say  $\phi$  is a *theorem*.

#### **Examples:**

- $\vdash A \land B \rightarrow A$
- $\vdash \neg (A \land B) \rightarrow \neg A \lor \neg B$

Let's define a judgment that that a formula is true given a set of assumptions  $\Gamma$ :

$$\Gamma \vdash \phi$$

where  $\Gamma$  is just a list of formulas.

If  $\vdash \phi$  (with no assumptions), we say  $\phi$  is a *theorem*.

#### **Examples:**

- $\vdash A \land B \rightarrow A$
- $\vdash \neg (A \land B) \rightarrow \neg A \lor \neg B$
- *A*, *B*, *C* ⊢ *B*

Let's write the rules for our judgment:

$$\frac{\Gamma \vdash \phi \qquad \Gamma \vdash \psi}{\Gamma \vdash \phi \land \psi} \land \text{-INTRO}$$

#### Let's write the rules for our judgment:

$$\frac{\Gamma \vdash \phi \qquad \Gamma \vdash \psi}{\Gamma \vdash \phi \land \psi} \land \text{-INTRO}$$
 
$$\frac{\Gamma \vdash \phi \land \psi}{\Gamma \vdash \phi} \land \text{-ELIM1} \qquad \frac{\Gamma \vdash \phi \land \psi}{\Gamma \vdash \psi} \land \text{-ELIM2}$$

#### Let's write the rules for our judgment:

$$\begin{split} \frac{\Gamma \vdash \phi \qquad \Gamma \vdash \psi}{\Gamma \vdash \phi \land \psi} \land \text{-intro} \\ \\ \frac{\Gamma \vdash \phi \land \psi}{\Gamma \vdash \phi} \land \text{-elim1} \qquad \frac{\Gamma \vdash \phi \land \psi}{\Gamma \vdash \psi} \land \text{-elim2} \\ \\ \frac{\Gamma, \phi \vdash \psi}{\Gamma \vdash \phi \to \psi} \to \text{-intro} \end{split}$$

(

Let's write the rules for our judgment:

$$\begin{split} \frac{\Gamma \vdash \phi \qquad \Gamma \vdash \psi}{\Gamma \vdash \phi \land \psi} \land \text{-Intro} \\ \\ \frac{\Gamma \vdash \phi \land \psi}{\Gamma \vdash \phi} \land \text{-elim1} \qquad \frac{\Gamma \vdash \phi \land \psi}{\Gamma \vdash \psi} \land \text{-elim2} \\ \\ \frac{\Gamma, \phi \vdash \psi}{\Gamma \vdash \phi \to \psi} \to \text{-intro} \end{split}$$

...and so on.

$$\frac{\Gamma,\phi\vdash\psi}{\Gamma\vdash\phi\to\psi} \to \text{-INTRO} \qquad \frac{\Gamma\vdash\phi\to\psi}{\Gamma\vdash\psi} \to \text{-ELIM}$$
 
$$\frac{\Gamma\vdash\phi}{\Gamma\vdash\phi\wedge\psi} \land \text{-INTRO} \qquad \frac{\Gamma\vdash\phi\land\psi}{\Gamma\vdash\phi} \land \text{-ELIM1} \qquad \frac{\Gamma\vdash\phi\land\psi}{\Gamma\vdash\psi} \land \text{-ELIM2}$$
 
$$\frac{\Gamma\vdash\phi}{\Gamma\vdash\phi\lor\psi} \lor \text{-INTRO1} \qquad \frac{\Gamma\vdash\psi}{\Gamma\vdash\phi\lor\psi} \lor \text{-INTRO2}$$
 
$$\frac{\Gamma\vdash\phi\lor\psi}{\Gamma\vdash\phi\lor\psi} \lor \text{-INTRO2}$$
 
$$\frac{\Gamma\vdash\phi\lor\psi}{\Gamma\vdash\psi} \lor \text{-INTRO2}$$
 
$$\frac{\Gamma\vdash\phi\lor\psi}{\Gamma\vdash\psi} \lor \text{-INTRO2}$$
 
$$\frac{\Gamma\vdash\psi\to\psi}{\Gamma\vdash\psi} \lor \text{-ELIM}$$
 
$$\frac{\Gamma,P\vdash\phi}{\Gamma\vdash\forall P\cdotp\phi} \lor \text{-INTRO} \qquad \frac{\Gamma\vdash\forall P\cdotp\phi}{\Gamma\vdash\phi\{\psi/P\}} \lor \text{-ELIM}$$

Let's try a proof! We can write a proof that  $A \wedge B \rightarrow B \wedge A$  is a theorem.

Let's try a proof! We can write a proof that  $A \wedge B \to B \wedge A$  is a theorem.

$$\frac{\frac{\overline{A \land B \vdash A \land B}}{A \land B \vdash B} \stackrel{\mathsf{AXIOM}}{\land} \land \mathsf{-ELIM2}}{\frac{\overline{A \land B \vdash A \land B}}{A \land B \vdash A}} \land \mathsf{-ELIM1}}_{\stackrel{\mathsf{A} \land B \vdash B \land A}{\vdash A \land B \rightarrow B \land A}} \land \mathsf{-INTRO}$$

Let's try a proof! We can write a proof that  $A \wedge B \rightarrow B \wedge A$  is a theorem.

$$\frac{\frac{\overline{A \land B \vdash A \land B}}{A \land B \vdash B} \stackrel{\mathsf{AXIOM}}{\land} \land \mathsf{-ELIM2}}{\frac{\overline{A \land B \vdash A \land B}}{A \land B \vdash A}} \land \mathsf{-ELIM1}}{\frac{A \land B \vdash B \land A}{\land} \land \mathsf{-INTRO}}{} \rightarrow \mathsf{-INTRO}$$

Does this look familiar?

Let's try a proof! We can write a proof that  $A \wedge B \rightarrow B \wedge A$  is a theorem.

$$\frac{\frac{\overline{A \land B \vdash A \land B}}{A \land B \vdash B} \overset{\mathsf{AXIOM}}{\land} \land \mathsf{-ELIM2}}{\frac{\overline{A \land B \vdash A \land B}}{A \land B \vdash A}} \land \mathsf{-ELIM1}}_{A \land B \vdash B \land A} \land \mathsf{-INTRO}}_{\vdash A \land B \to B \land A} \to \mathsf{-INTRO}$$

#### Does this look familiar?

$$\frac{\frac{\overline{x:A\times B \vdash x:A\times B}}{x:A\times B \vdash x:A\times B} \text{ T-VAR}}{x:A\times B \vdash \#2 x:B} \text{ T-\#1} \qquad \frac{\overline{x:A\times B \vdash x:A\times B}}{x:A\times B \vdash \#1 x:A} \text{ T-\#2}}{x:A\times B \vdash \#1 x:A} \\ \frac{\overline{x:A\times B \vdash \#1 x:A}}{\vdash \lambda x. \ (\#2 \ x, \#1 \ x):A\times B \rightarrow B\times A} \text{ T-PAIR}}{\vdash \lambda x. \ (\#2 \ x, \#1 \ x):A\times B \rightarrow B\times A}$$

Every natural deduction proof tree has a corresponding type tree in System F with product and sum types! And vice-versa!

Type Systems			ormal Logic
$\tau$	Type	$\phi$	Formula
$\tau$	is inhabited	$\phi$	is a theorem
е	Well-typed expression	$\pi$	Proof

A program with a given type acts as a *witness* that the type's corresponding formula is true.

Every type rule in System F with product and sum types corresponds 1-1 with a proof rule in natural deduction:

Type Systems		Formal Logic	
$\rightarrow$	Function	$\rightarrow$	Implication
×	Product	$\wedge$	Conjunction
+	Sum	V	Disjunction
$\forall$	Universal	$\forall$	Quantifier

You can even add existential types to correspond to existential quantification. It still works!

Every type rule in System F with product and sum types corresponds 1-1 with a proof rule in natural deduction:

Type Systems		Formal Logic	
$\rightarrow$	Function	$\rightarrow$	Implication
×	Product	$\wedge$	Conjunction
+	Sum	V	Disjunction
$\forall$	Universal	$\forall$	Quantifier

You can even add existential types to correspond to existential quantification. It still works!

Is this a coincidence? Natural deduction was invented by a German logician in 1935. Types for the  $\lambda$ -calculus were invented by Church at Princeton in 1940.

## Term Assignment

This all means that we have a new way of proving theorems: writing programs!

## **Term Assignment**

This all means that we have a new way of proving theorems: writing programs!

To prove a formula  $\phi$ :

- 1. Convert the  $\phi$  into its corresponding type  $\tau$ .
- 2. Find some program v that has the type  $\tau$ .
- 3. Realize that the existence of v implies a type tree for  $\vdash v : \tau$ , which implies a proof tree for  $\vdash \phi$ .

## **Negation and Continuations**

Let's explore one extension. We'd like to use this rule from classical logic:

$$\frac{\Gamma \vdash \phi}{\Gamma \vdash \neg \neg \phi}$$

but there's no obvious correspondence in System F.

## **Negation and Continuations**

Let's explore one extension. We'd like to use this rule from classical logic:

$$\frac{\Gamma \vdash \phi}{\Gamma \vdash \neg \neg \phi}$$

but there's no obvious correspondence in System F.

Recall that  $\neg \phi$  is shorthand for  $\phi \to \bot$ . So  $\neg \neg \phi$  corresponds to the System F function type  $(\tau \to \bot) \to \bot$ .

So what we need is a way to take any program of any type  $\tau$  and turn it into a program of type  $(\tau \to \bot) \to \bot$ .

## Negation and Continuations

Let's explore one extension. We'd like to use this rule from classical logic:

$$\frac{\Gamma \vdash \phi}{\Gamma \vdash \neg \neg \phi}$$

but there's no obvious correspondence in System F.

Recall that  $\neg \phi$  is shorthand for  $\phi \to \bot$ . So  $\neg \neg \phi$  corresponds to the System F function type  $(\tau \to \bot) \to \bot$ .

So what we need is a way to take any program of any type  $\tau$  and turn it into a program of type  $(\tau \to \bot) \to \bot$ .

Shockingly, that's exactly what the CPS transform does! A au becomes a function that takes a continuation au o o o and invokes it, producing o.
